

Security Policy

13/03/2024

<https://bartoli.inginf.units.it>

1

Important questions (I)

- ☐ PC
- ☐ Dropbox app
- ☐ Chrome browser

- ☐ Can the Dropbox app read authentication cookies?
- ☐ ...passwords stored in the browser?
- ☐ ...encryption keys in the browser memory?

13/03/2024

<https://bartoli.inginf.units.it>

2

Important questions (II)

- ☐ PC
- ☐ Macro in Excel downloaded as an email attachment
- ☐ Chrome browser
- ☐ Can the Excel Macro read authentication cookies?
- ☐ ...passwords stored in the browser?
- ☐ ...encryption keys in the browser memory?

13/03/2024

<https://bartoli.inginf.units.it>

3

Important questions (III)

- ☐ Smartphone
- ☐ Banking app
- ☐ Gaming app
- ☐ Can the Gaming app read the authentication token of Banking app?

13/03/2024

<https://bartoli.inginf.units.it>

4

Security Policy (I)

- ❑ **Set of rules** that determine "**who can do what**"
- ❑ **Every system** has one, **explicit** or **implicit**
 - ❑ Usually implicit
- ❑ We need to **understand** how these rules are structured in practice

13/03/2024

<https://bartoli.inginf.units.it>

5

Even more important questions (I)

- ❑ User U executes GUI / Shell on a PC
- ❑ How can you make sure that the GUI / Shell can only execute operations allowed to U?
- ❑ You execute "your code" P on a PC
- ❑ How can you make sure that P cannot modify the internal code/data of the o.s.?

13/03/2024

<https://bartoli.inginf.units.it>

6

Even more important questions (II)

- ❑ esse3 webapp
- ❑ Student S1 logged in
- ❑ How can you make sure that S1 cannot see data of other students?
- ❑ ...modify grades?

13/03/2024

<https://bartoli.inginf.units.it>

7

Security Policy (II)

- ❑ **Set of rules** that determine "**who can do what**"
- ❑ **Every system** has one, explicit or implicit
 - ❑ Usually implicit
- ❑ We need to **understand** how these rules are structured in practice
- ❑ And how they are **enforced**

13/03/2024

<https://bartoli.inginf.units.it>

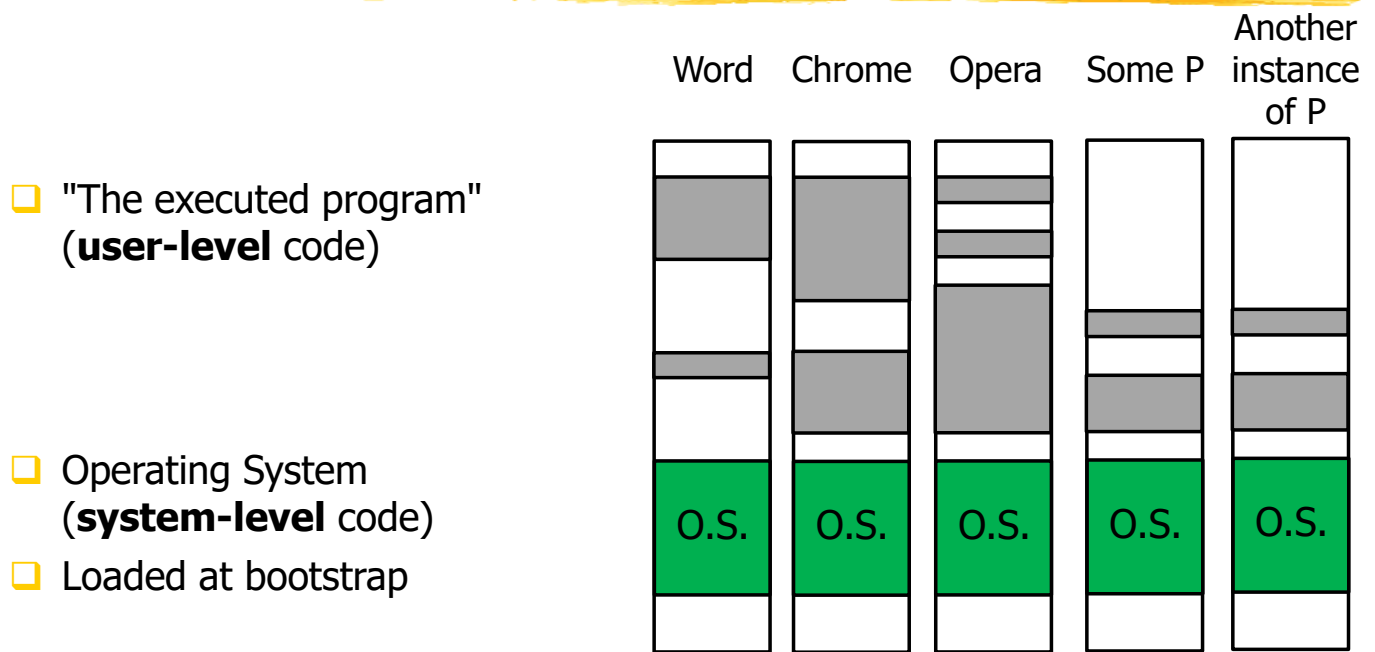

8

Roadmap

1. How described, in an idealized way
 2. How enforced
 3. How described, in a more realistic way
- ❑ Several important / fundamental observations
 - ❑ Very simplified (many details omitted)

O.S. Protection (in a nutshell)

Process Address Space (I)

13/03/2024

<https://bartoli.inginf.units.it>

11

Process Address Space (II)

- ❑ Every process has **its own** address space
- ❑ Address spaces are **isolated** from each other
 - ❑ CPU executes process P and issues `addr-x`
 - ❑ CPU executes process Q and issues `addr-x`
 - ❑ The referenced cell is **different** (it might contain the same value)
- ❑ Isolation implemented by **hardware + O.S.**
 - ❑ The O.S. places itself in **every** address space

13/03/2024

<https://bartoli.inginf.units.it>

12

Virtual Memory vs Physical Memory

- ❑ CPU executes process P and issues `addr-x`
- ❑ CPU executes process Q and issues `addr-x`
 - ❑ **Virtual** memory
- ❑ The referenced cell is **different** (it might contain the same value)
 - ❑ **Physical** memory
- ❑ Isolation implemented by **hardware + O.S.**
 - ❑ CPU emits (process-id, v-address)
 - ❑ Hardware with o.s. data maps to (p-address)
- ❑ Process address space: **virtual** memory
- ❑ Machine address space: **physical** memory

13/03/2024

<https://bartoli.inginf.units.it>

13

Address Space Size: Virtual vs Physical

- ❑ **Virtual** address space size
 - ❑ Memory of **each** process: 2^{64} addresses
 - $\Rightarrow 2^{44} * 2^{20}$
 - $\Rightarrow 2^{44}$ G
 - $\Rightarrow 2^{32} * 2^{12}$ G
 - $\Rightarrow 4 * 10^9 * 1024$ G
- ❑ **Physical** address space size
 - ❑ How much memory does your PC have? Maybe **16** GB?

- ❑ **A lot of** virtual mem. mapped **to much smaller** physical mem.

13/03/2024

<https://bartoli.inginf.units.it>

14

(Virtual) Address Space Allocation

- ❑ Every address space has parts that are **unallocated** (≈ not usable)
- ❑ CPU attempts to access an unallocated address ⇒
 1. Hardware error ((process-id, v-address) → memory fault)
 2. O.S. procedure called automatically (memory fault handler)
- ❑ I am neglecting swapping on secondary storage for simplicity...

13/03/2024

<https://bartoli.inginf.units.it>

15

Operating System

- ❑ The O.S. places itself in **every** address space

- ❑ Code
- ❑ Variables
 - ❑ Open sockets
 - ❑ Open files
 - ❑ "Permissions"
 - ❑ ...

13/03/2024

<https://bartoli.inginf.units.it>

16

Hhmmm...

- ❑ A **malicious process** could attempt to:
 - ❑ Read o.s. variables
 - ❑ Write o.s. variables
 - ❑ Jump to arbitrary o.s. addresses
- ❑ Read sensitive information (crypto keys / passwords / ...)
- ❑ Modify "access rights" (access files that should not be accessed)
- ❑ Skip permission checks

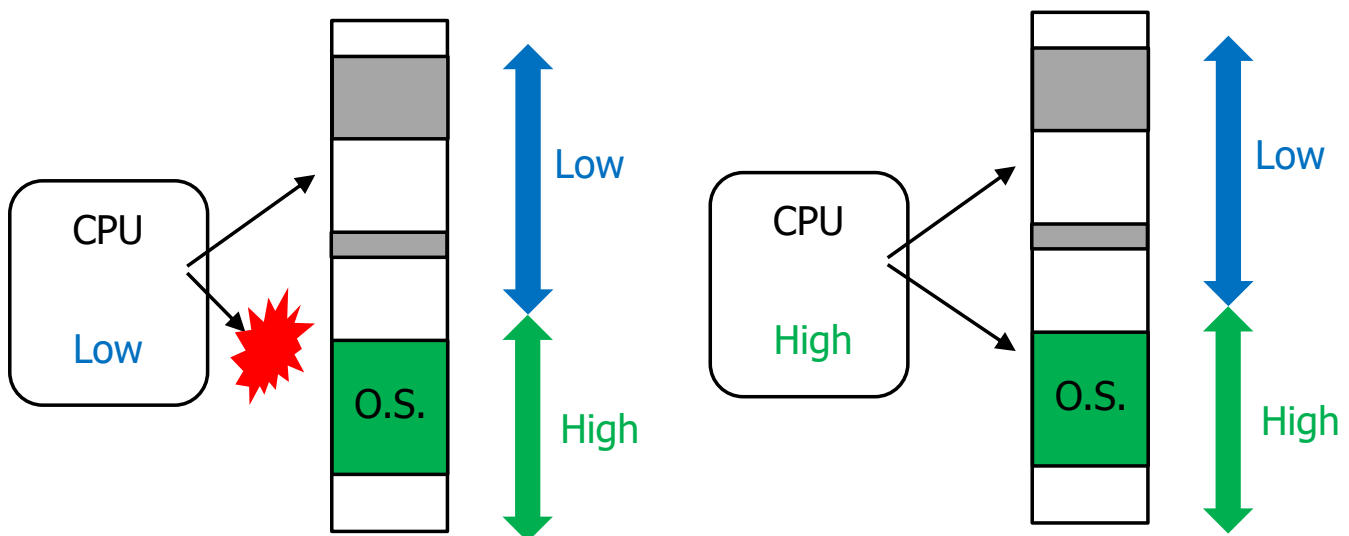

13/03/2024

<https://bartoli.inginf.units.it>

17

CPU Privilege Level: Memory Access Rights

- ❑ Every CPU has (at least) two privilege levels: High and Low
 - ❑ High ⇒ CPU can access **every** address
 - ❑ Low ⇒ CPU can access only **some** addresses

13/03/2024

<https://bartoli.inginf.units.it>

18

CPU Privilege Level: Privilege Switch

❑ Privilege level switch occurs in **hardware**

❑ **Low → High**

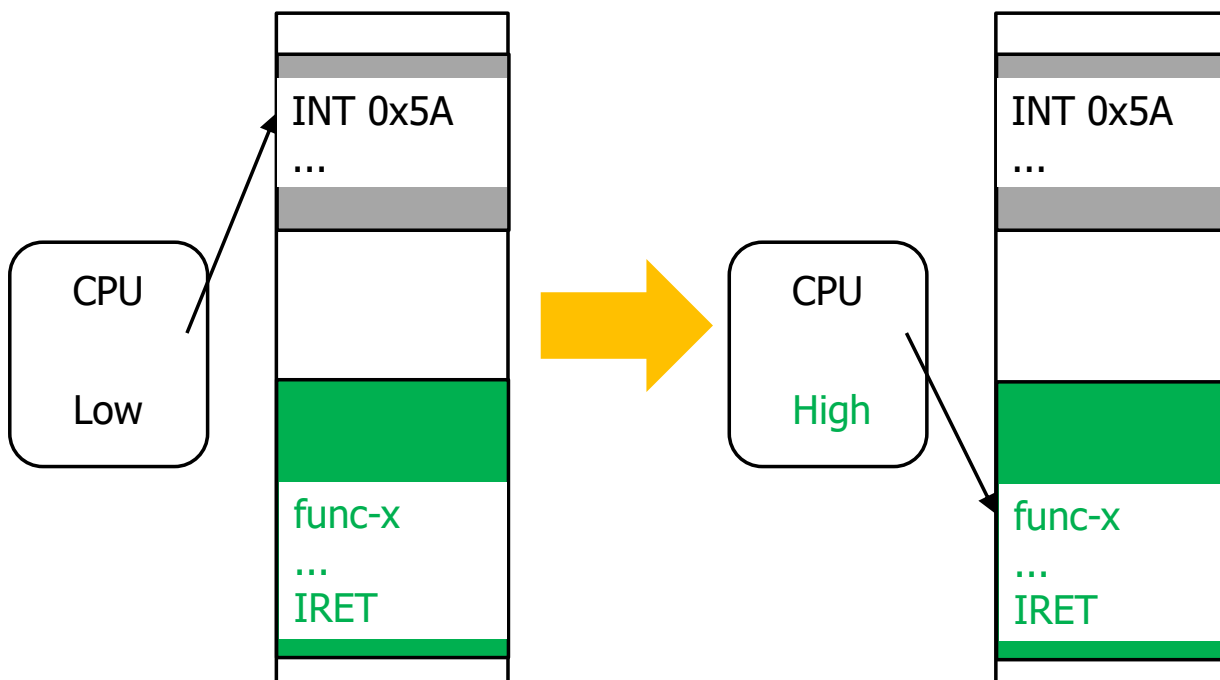

❑ INT operand Calls a function in the o.s.

❑ Mapping operand values → functions **predetermined** by the o.s.

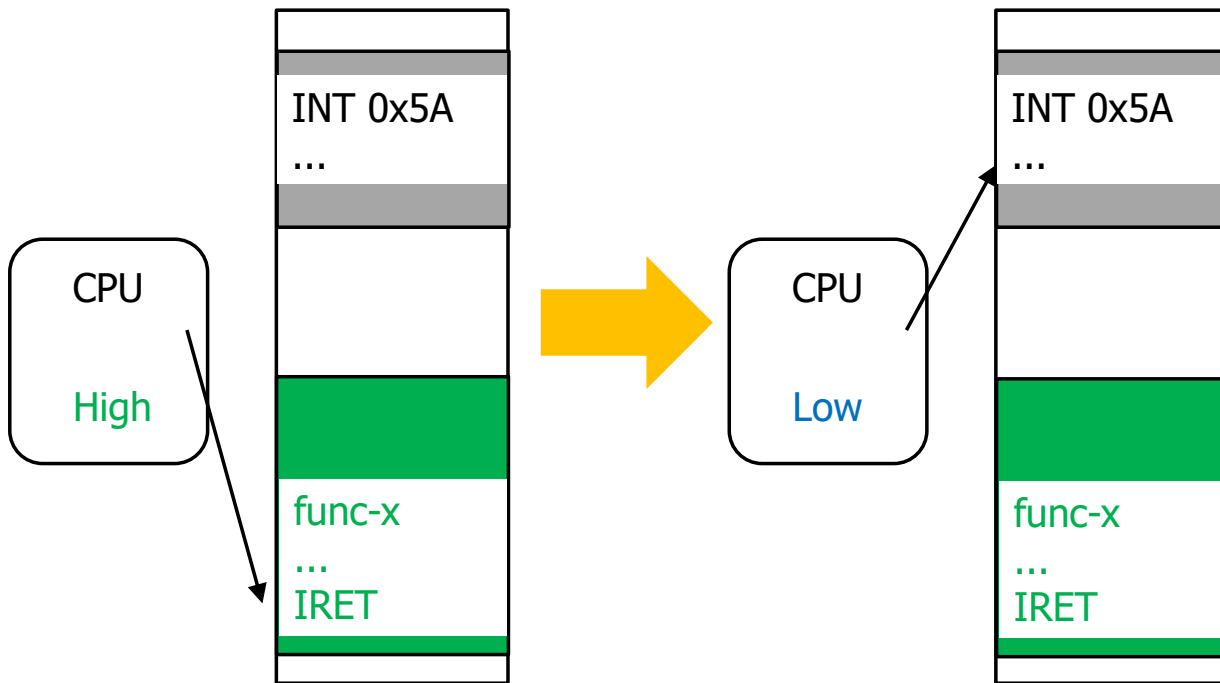

❑ **High → Low**

❑ IRET Return to caller user code

System Call Invocation

System Call Return

13/03/2024

<https://bartoli.inginf.units.it>

21

Remark

- ❑ CPU does **not** use operand as an address
- ❑ CPU uses operand as an **offset** in an o.s. table (that contains addresses)

- ❑ Untrusted code can **only** call **predefined** addresses

13/03/2024

<https://bartoli.inginf.units.it>

22

O.S. Integrity

- ❑ A malicious process could attempt to:
 - ❑ Read o.s. variables
 - ❑ Write o.s. variables
 - ❑ Jump to arbitrary o.s. addresses
- ❑ **Not possible:**
 - ❑ Read / Write o.s. variables
(it executes with Low privilege)
 - ❑ Jump to arbitrary o.s. addresses
(it can only call predefined addresses)

13/03/2024

<https://bartoli.inginf.units.it>

23

Keep in mind

- ❑ User-level program executes with **Low** privilege
- ❑ O.S. executes with **High** privilege

- ❑ User-level program:
 - ❑ Cannot access O.S. data
 - ❑ Can enter O.S. only at predefined points
(by invoking a system call)

13/03/2024

<https://bartoli.inginf.units.it>

24

Resource Access

- ❑ Every **resource** is implemented by the o.s.
 - ❑ File
 - ❑ Socket
 - ❑ Screen
 - ❑ Process management
 - ❑ Access rights
 - ❑ ...
- ❑ Every **operation** on a **resource** occurs by invoking a **system call**
- ❑ The o.s. decides whether to **grant** or **deny** the operation
 - ❑ We will see based on which criteria

13/03/2024

<https://bartoli.inginf.units.it>

25

Isolation (I)

- ❑ A process **cannot** access the memory of another process **directly**
 - ❑ (P,v-address) and (Q, v-address) always map to **different** physical memory regions
 - ❑ ...except for v-address of the o.s.

13/03/2024

<https://bartoli.inginf.units.it>

26

Isolation (II)

- ❑ A process can invoke a **system call** for reading/writing the memory of **another** process
- ❑ Typical input parameters
 - ❑ p-address
 - ❑ how-many
 - ❑ Q
 - ❑ q-address
- ❑ The o.s. decides whether to **grant** or **deny** the operation

Accounts and Resources

Account ("User")

- **Account**: Every **identity** in the system
 - **Username** (string)
 - **Credentials** for the initial authentication
 - **Internal identifier** used by the o.s.
- Accounts are often called "Users"
- ...which may be misleading:
certain accounts are **not** meant to be owned by a human operator

13/03/2024

<https://bartoli.inginf.units.it>

29

Process ↔ Account

- Every **Process** is associated with an **Account**
 - A field in the process descriptor within the o.s.
- Basic ideas (more details later)
 - Bootstrap: Root/System account
 - Server Process: Account specified in o.s. configuration
 - GUI / Shell Process: Account that has provided credentials
 - Child Process: **same** Account as the Parent process
 - Special case:
Process of Root/System can choose **any** Account for its children

13/03/2024

<https://bartoli.inginf.units.it>

30

Resource

❑ **Resource:** Every "**object**" in the system

- ❑ File
- ❑ Socket
- ❑ Process
- ❑ I/O device
- ❑ ...

❑ Every **resource access** occurs through a **System Call**

- ❑ Process invokes a system call
- ❑ Parameters specify which operation on which resource

13/03/2024

<https://bartoli.inginf.units.it>

31

Access Control "Model" (preliminary)

Every access to **resources**
is mediated (**guarded**) by the O.S.

How does the o.s. decide whether
to grant or deny?

13/03/2024

<https://bartoli.inginf.units.it>

32

Resource ↔ Account

- ❑ Every Resource is **owned** by an Account
- ❑ Usually it is the Account that **created** the Resource
- ❑ The owner of a resource decides who can do what on the resource

13/03/2024

<https://bartoli.inginf.units.it>

33

Resource ↔ ACL

- ❑ Every Resource has an ACL (**Access Control List**):
 - ❑ For each Account, Operations that it can execute
- ❑ System Call execution decides whether to **grant** or **deny**:
 - ❑ Input: Account, Operation, Resource
 - ❑ O.S. data: Resource.ACL
- ❑ Resource.Owner controls Resource.ACL
 - ❑ Operations that modify R.ACL are granted to R.Owner
 - ❑ R.owner might decide to grant other accounts the rights to modify R.ACL ("with constraints")

13/03/2024

<https://bartoli.inginf.units.it>

34

Access Control "Model"

Every access to **resources** is mediated (**guarded**) by the O.S.

- ❑ Think in terms of this model
- ❑ Not of how it is implemented
 - ❑ Process invokes System call
 - ❑ Low / High CPU privilege
 - ❑ ...

"High Privilege" Account

- ❑ Each o.s. has one or more **predefined** accounts with **"high privilege"**
 - ❑ Linux `root` (internal id 0)
 - ❑ Windows `NT Authority\SYSTEM` (internal id "complex")
 - ❑ Windows `Administrator` (internal id "complex")
- ❑ \approx They can execute **every** operation on **every** resource
 - ❑ Linux: operation requests issued by `root` are granted irrespective of the content of the ACL
 - ❑ Windows: every ACL grants full control to `SYSTEM` and `Administrator`

Windows: Security Identifier (SID)

- ❑ **Process identifier** for **access control** decisions
- ❑ **String** whose structure has a certain semantics
- ❑ High privilege SID:
 - ❑ Administrator
S-1-5-21-1559272821-92556266-1055285598-500
 - ❑ NT AUTHORITY/SYSTEM
S-1-15-18
- ❑ Groups also have a SID

13/03/2024

<https://bartoli.inginf.units.it>

37

High Privilege Account: What it means

- ❑ ≈ They can execute **every** operation on **every** resource
- ❑ ≈ Every system call invocation by a process of a High Privilege account will succeed
- ❑ Examples:
 - ❑ "Read memory page M of process P in my buffer B"
 - ❑ "Write my buffer B in memory page M of process P"

13/03/2024

<https://bartoli.inginf.units.it>

38

High Privilege Account: What it does NOT mean

- ☐ ~~Can access every memory address~~

- ☐ It is an **o.s.** concept: not an **hardware** concept

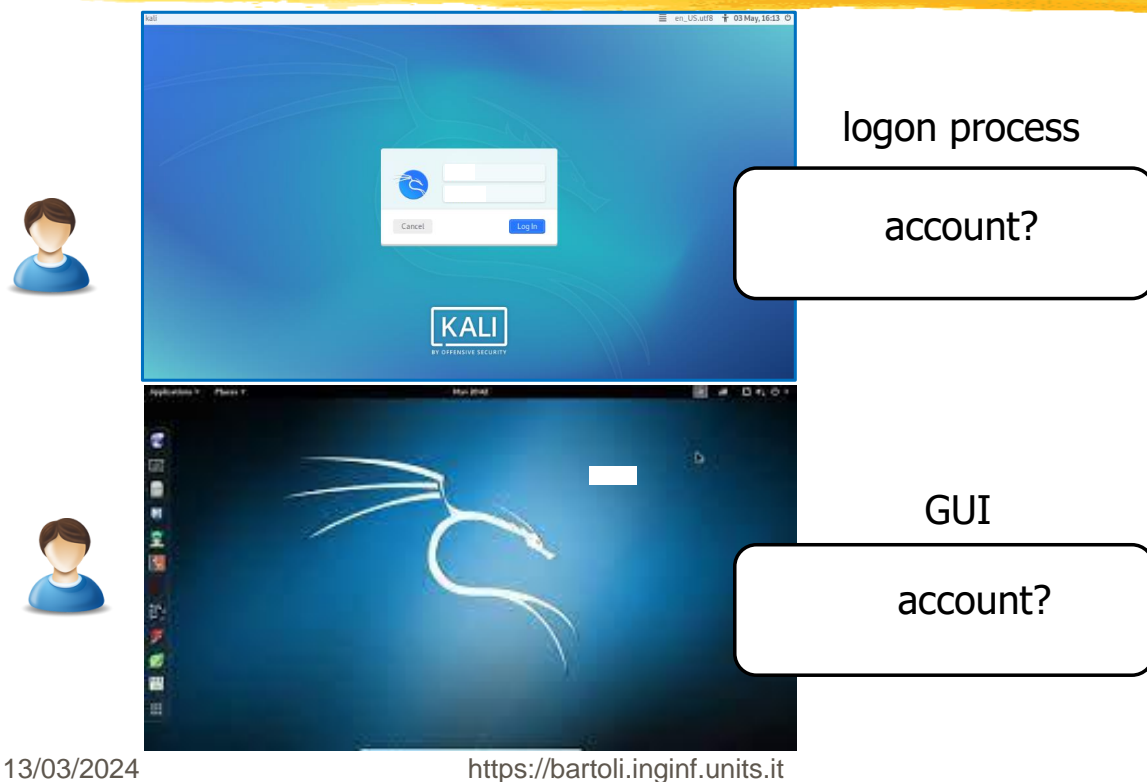

13/03/2024

<https://bartoli.inginf.units.it>

39

Understanding Account ↔ Process

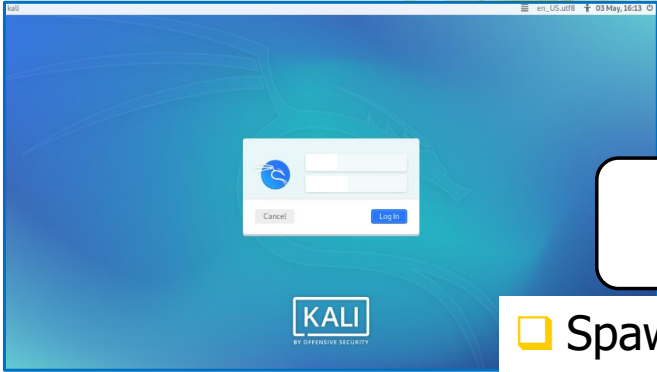

Account ↔ Process: Interactive Logon

Bootstrap

- ❑ **First** process:
 - ❑ Associated with an account with **high privilege**
 - ❑ Spawns many **child processes** (usually servers)
 - ❑ Child processes can change account **at their will** (because they start with high privilege)
 - ❑ Usually accounts of **lower** privilege
- ❑ Configuration information describes which servers and which accounts

Interactive Logon (I)

A screenshot of the Kali Linux login screen. It features a blue background with the Kali Linux logo at the bottom. A login window is centered, showing a user icon, a password field, and 'Cancel' and 'Login' buttons. To the left of the screen is a small user icon. To the right, a text box contains 'root / SYSTEM'. Below the screen, two bullet points are listed: 'Spawnd during bootstrap' and 'Account with high privilege'.

logon process

root / SYSTEM

- Spawnd during bootstrap
- Account with high privilege

1. Wait for credentials
2. ...
3. ...

Interactive Logon (II)

A screenshot of the Kali Linux desktop environment. It shows a blue background with a white dragon logo. A taskbar is visible on the left side. To the left of the screen is a small user icon. To the right, a text box contains 'A2'. Above the screen, the text 'GUI process' is displayed.

GUI process

A2

1. Wait for credentials
2. Validate credentials (authenticate account A2)
3. Spawn GUI process that changes account to A2

Changing Account

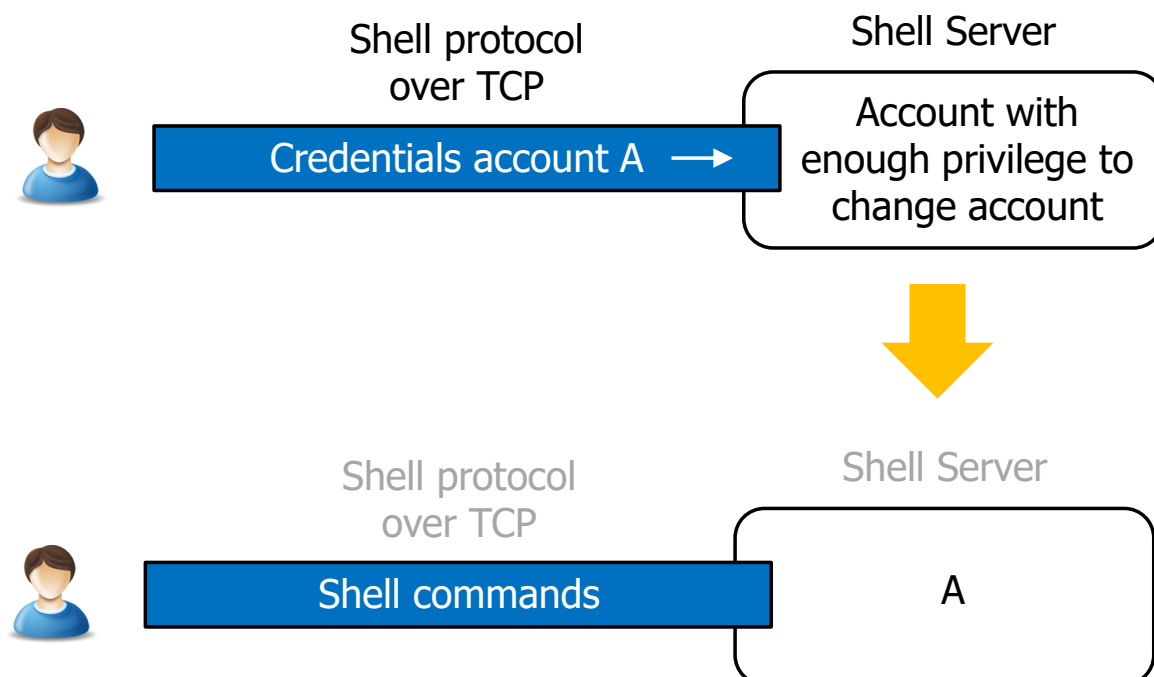

- ❑ Allowed only to **high privilege** accounts
- ❑ Linux `setuid()`
- ❑ Windows `ImpersonateLoggedOnUser`

13/03/2024

<https://bartoli.inginf.units.it>

45

Account ↔ Process: Remote Shell

13/03/2024

<https://bartoli.inginf.units.it>

46

Crucial Scenario: Command Execution

- ❑ Shell / GUI associated with A-SH
- 1. Executes command/program in file F owned by A-F
- 2. ...that creates a file R

- ❑ What happens in terms of processes and accounts?

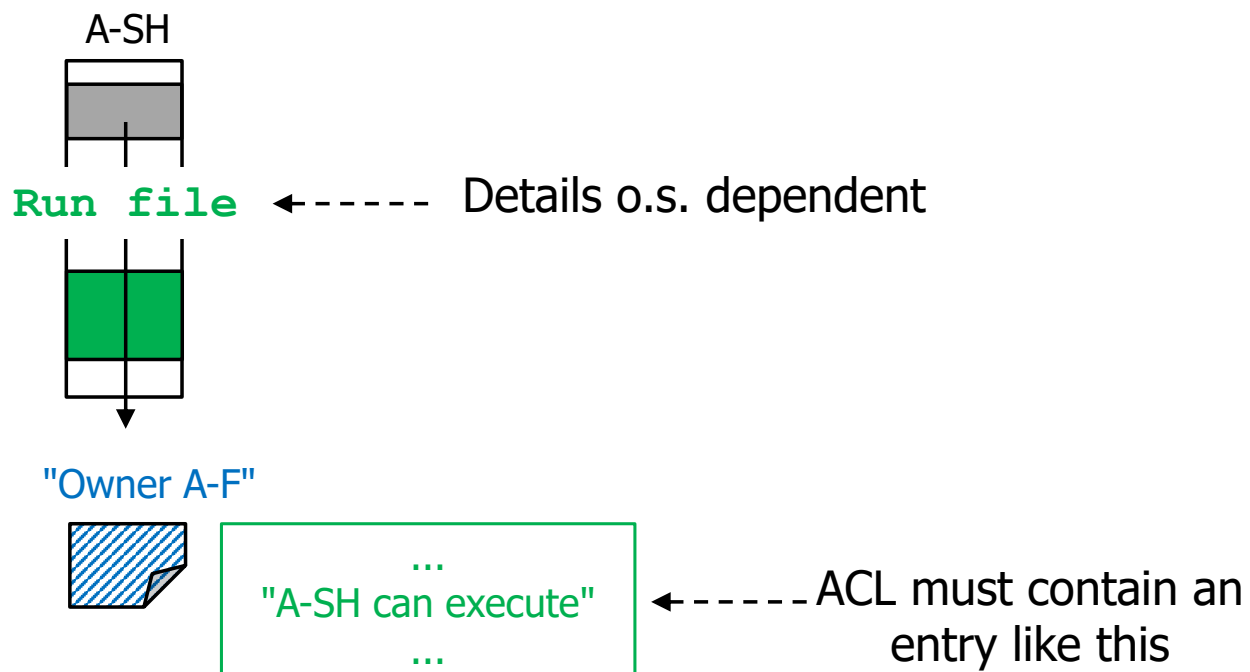

13/03/2024

<https://bartoli.inginf.units.it>

47

1: Shell / GUI executes F (I)

13/03/2024

<https://bartoli.inginf.units.it>

48

1: Shell / GUI executes F (II)

13/03/2024

<https://bartoli.inginf.units.it>

49

Account?

13/03/2024

<https://bartoli.inginf.units.it>

50

Important Remark

- ❑ Shell / GUI associated with A-SH
 1. Executes command/program in file F owned by A-F
 2. ...that creates a file R
- ❑ One process for each command
- ❑ **"Shell identity everywhere"** (processes, created resources)
- ❑ The owner of the executable files is **irrelevant**
- ❑ Except for specific cases...

Linux suid

Command Execution: Specific need (I)

- ❑ Shell or GUI process associated with A-SH
- ❑ Execute **one command** with a **different** account
 - ❑ **Password** of the destination account **required**
- ❑ Temporary **impersonation**

13/03/2024

<https://bartoli.inginf.units.it>

55

Command Execution: Specific need (II)

13/03/2024

<https://bartoli.inginf.units.it>

56

Solution (in a nutshell)

- ❑ Shell or GUI process associated with A-SH
- ❑ Execute **one command** with a **different** account
 - ❑ **Password** of the destination account **required**
- ❑ Temporary **impersonation**
- ❑ Linux sudo
- ❑ Windows Run as Administrator
- ❑ Various configurations / constraints possible (e.g., multiple commands)

13/03/2024

<https://bartoli.inginf.units.it>

57

Command Execution: More Specific need (I)

- ❑ Shell or GUI process associated with A-SH
- ❑ Execute **one command** with a **different** account
- ❑ Temporary **impersonation**
 - ❑ Account of the **owner** of the command file
 - ❑ **No password required**
- ❑ Different point of view:
 - ❑ A-X encodes certain actions in a program
 - ❑ Everyone can execute those actions **as A-X (without A-X password)**

13/03/2024

<https://bartoli.inginf.units.it>

58

Command Execution: More Specific need (II)

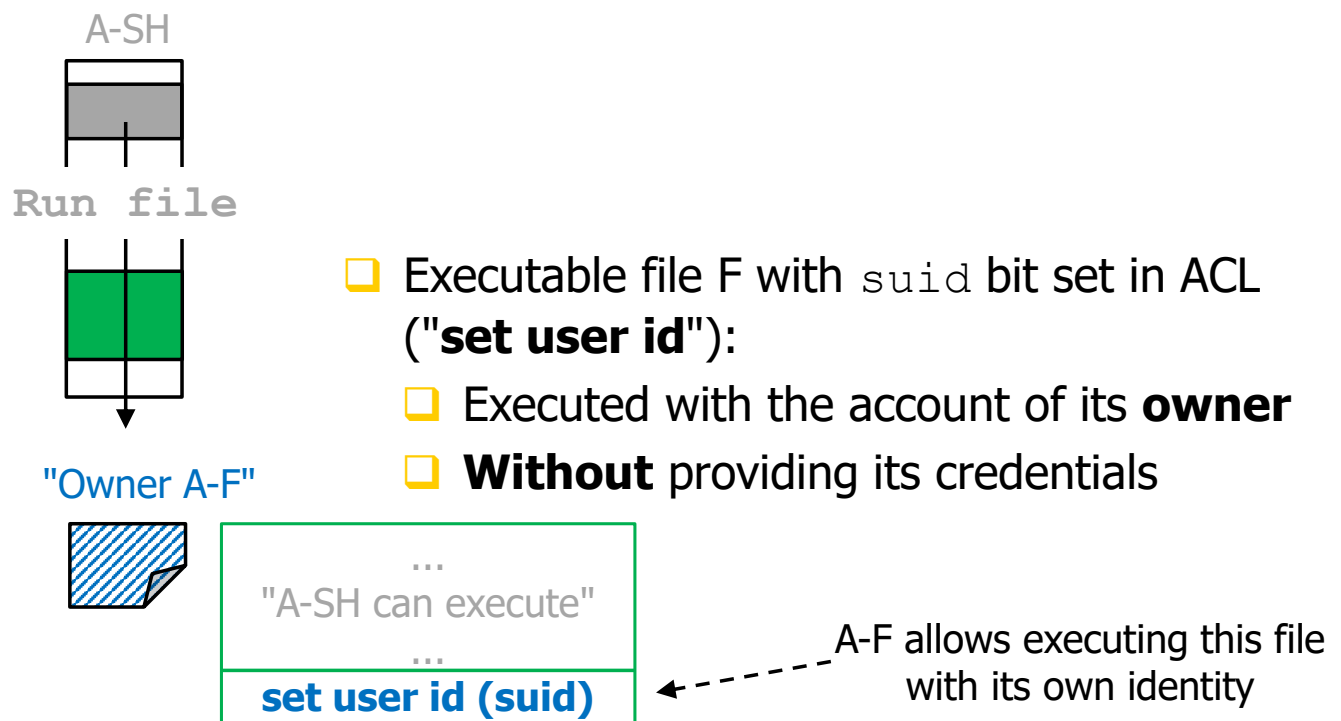

13/03/2024

<https://bartoli.inginf.units.it>

59

Linux `suid`

13/03/2024

<https://bartoli.inginf.units.it>

60

Common Use Case

- ❑ Different point of view:
 - ❑ A-X encodes certain actions in a program
 - ❑ Everyone can execute those actions **as A-X** (**without A-X password**)
 - ❑ A-X is **high privilege**
- ❑ Example commands:
 - ❑ Mounting a disk
 - ❑ Changing the password of the shell user
 - ❑ ...

13/03/2024

<https://bartoli.inginf.units.it>

61

Interesting Question

- ❑ Shell A-SH
 - ❑ Its children are A-SH
 - ❑ Command `sudo` is a child
- ❑ How can `sudo` take a **different** identity?

13/03/2024

<https://bartoli.inginf.units.it>

62

How sudo works (outline) (I-a)

```
(kali㉿kali)-[~]  
$ which sudo  
/usr/bin/sudo  
  
(kali㉿kali)-[~]  
$ ls -l /usr/bin/sudo  
-rws [redacted] root root 261080 Oct 10 2022 /usr/bin/sudo
```

Executable file
with "set user id"

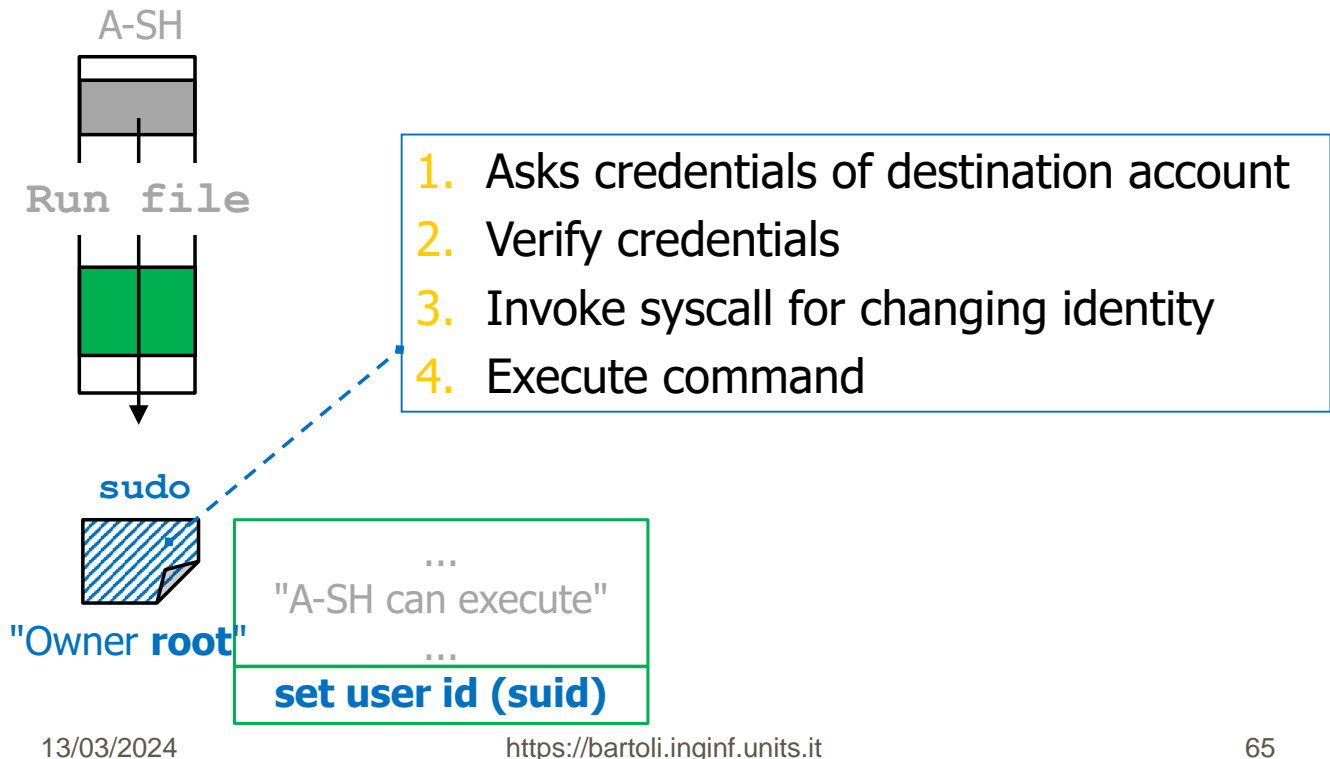

Owned by the
root account

How sudo works (outline) (I-b)

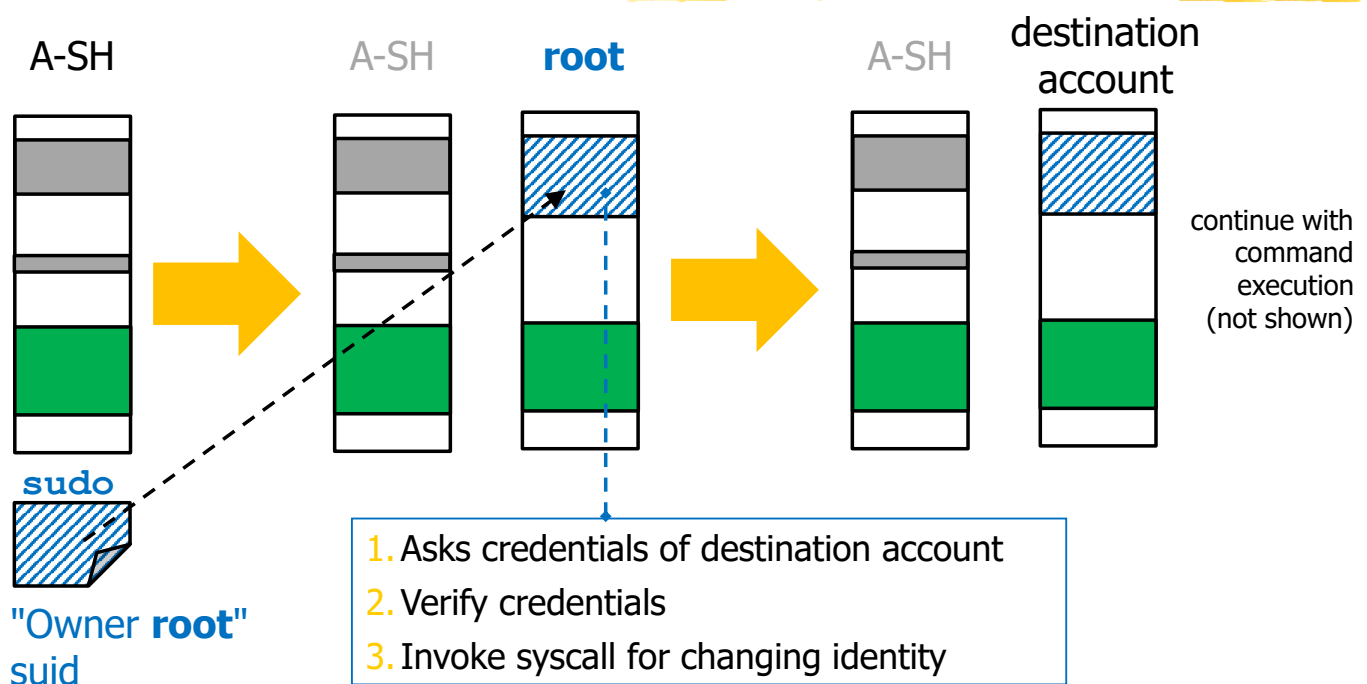

```
(kali㉿kali)-[~]  
$ which sudo  
/usr/bin/sudo  
  
(kali㉿kali)-[~]  
$ ls -l /usr/bin/sudo  
-rwsr-xr-x 1 root root 261080 Oct 10 2022 /usr/bin/sudo
```

Can be read and executed
(but **not modified**)
by any account

How sudo works (outline) (II)

How sudo works (outline) (III)

Linux `suid` summary

- ❑ **Temporary privilege elevation without credentials**

- ❑ It works for any owner...typical usage is for high privilege

- ❑ Example application: `sudo`

- ❑ **Risk:** behavior might not be as intended

- ❑ Mistakes

- ❑ Vulnerabilities

13/03/2024

<https://bartoli.inginf.units.it>

67

Back to the Important questions

Important question (I)

(REMIND)

- ❑ PC
- ❑ Dropbox app
- ❑ Chrome browser

- ❑ Can the Dropbox app read authentication cookies?
- ❑ ...passwords stored in the browser?
- ❑ ...encryption keys in the browser memory?

13/03/2024

<https://bartoli.inginf.units.it>

69

Answer in a nutshell

- ❑ Dropbox app and Chrome browser are Processes associated **with the same Account**
↓
- ❑ **Any** operation allowed for **one** Process is **also** allowed for the **other** Process
 - ❑ ACL: (**Account**, Operation)
↓
- ❑ Dropbox can read/modify anything that Chrome can read/modify

13/03/2024

<https://bartoli.inginf.units.it>

70

Important question (II)

(REMIND)

- ❑ PC
- ❑ Macro in Excel downloaded as an email attachment
- ❑ Chrome browser
- ❑ Can the Excel Macro read authentication cookies?
- ❑ ...passwords stored in the browser?
- ❑ ...encryption keys in the browser memory?

13/03/2024

<https://bartoli.inginf.units.it>

71

Answer in a nutshell

- ❑ Process that opens the email attachment and Chrome are Processes associated **with the same Account**
- ↓
- ❑ Same reasoning as before
 - ❑ Each process can perform the **same** operations as the other

13/03/2024

<https://bartoli.inginf.units.it>

72

Important question (III) (REMIND) + Answer

- ☐ Smartphone
- ☐ Banking app
- ☐ Gaming app
- ☐ Can the Gaming app read the authentication token of Banking app?
- ☐ As far as we know so far: Yes

13/03/2024

<https://bartoli.inginf.units.it>

73

Keep in mind 1

- ☐ ACLs have the form (**Account**, Operation)

- ☐ ACLs do not distinguish between **different commands** with the **same account**
- ☐ All processes with the same account can do the same things
- ☐ Irrespective of who developed their code

13/03/2024

<https://bartoli.inginf.units.it>

74

Keep in mind 2

- ❑ Account A takes a malware M

- ❑ M can perform anything that A can perform

- ❑ M may be more or less sophisticated
- ❑ ...but in principle it can perform anything:
A is (potentially) fully disrupted

Principle of Least Privilege

Common Server Config. (up to a few years ago)

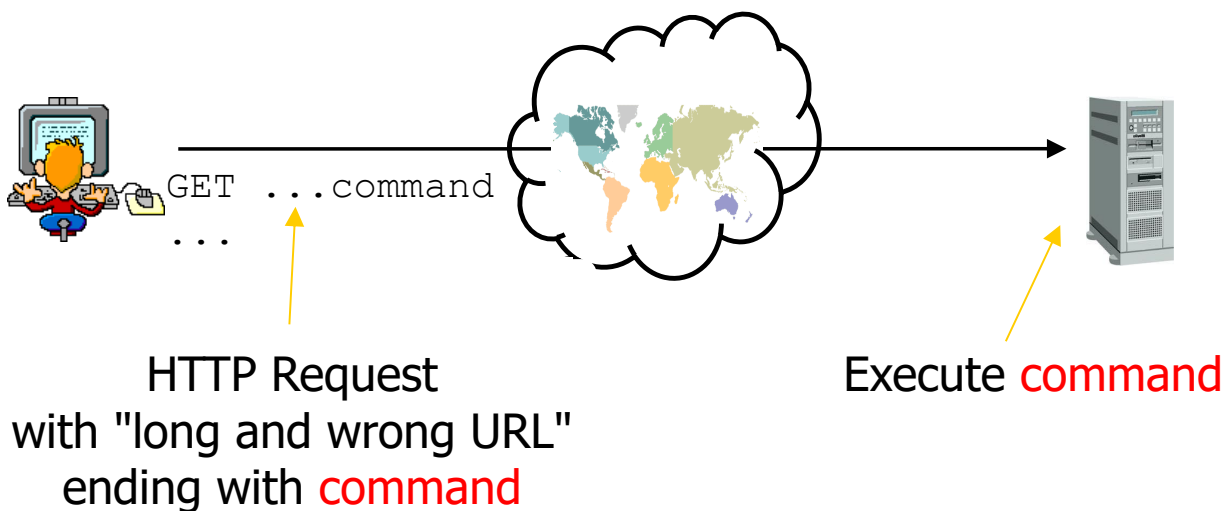

13/03/2024

<https://bartoli.inginf.units.it>

77

Example (Old but interesting) (I)

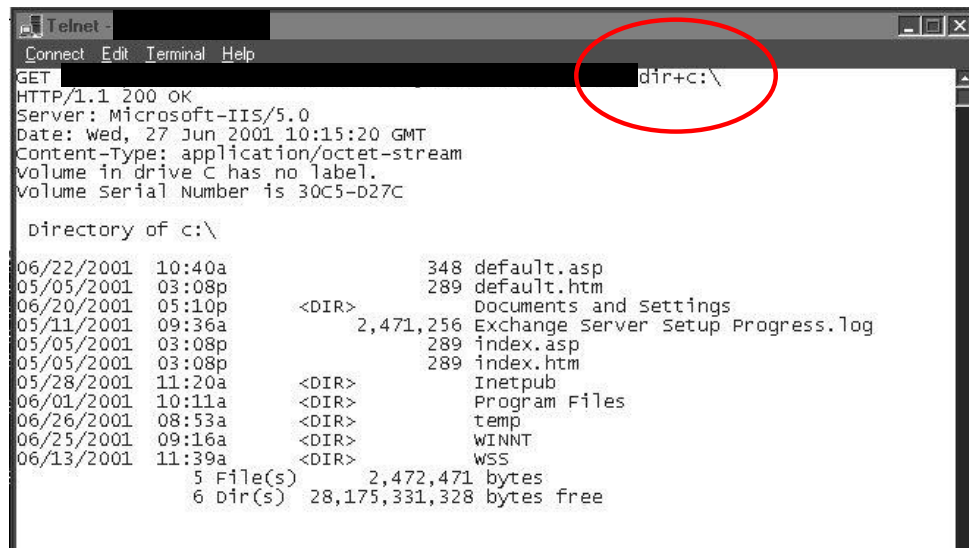

13/03/2024

<https://bartoli.inginf.units.it>

78

Example (Old but interesting) (II)

```
Telnet
Connect Edit Terminal Help
GET
HTTP/1.1 200 OK
Server: Microsoft-IIS/5.0
Date: Wed, 27 Jun 2001 10:15:20 GMT

06/25/2001 09:16a          <DIR>      WINNT
06/13/2001 11:39a          <DIR>      wss
5 File(s)          2,472,471 bytes
6 Dir(s)          28,175,331,328 bytes free
```

13/03/2024

<https://bartoli.inginf.units.it>

79

Which approach is wiser?

13/03/2024

<https://bartoli.inginf.units.it>

80

Principle of Least Privilege

- ❑ **Every** program and every user of the system should operate using the **least** set of privileges **necessary** to complete the job...
- ❑ It also reduces the number of potential interactions among privileged programs to **the minimum for correct operation**, so that **unintentional, unwanted, or improper** uses of privilege are **less likely** to occur...

❑ *Saltzer and Schroeder 1974 (!)*

- ❑ Please take a moment to reflect and admire its depth and generality
- ❑ We will find more examples of its relevance

13/03/2024

<https://bartoli.inginf.units.it>

81

Microsoft Exchange (March 2021): Ouch!

- ❑ Mail Server used by **a myriad of organizations**
- ❑ **Necessarily exposed to the Internet**
- ❑ "Exchange is, **by default**, installed with **some of the most powerful privileges** in Active Directory" (SYSTEM)
- ❑ Several vulnerabilities. Their chaining leads to:
 - ❑ **An unauthenticated attacker can execute arbitrary commands on Microsoft Exchange Server ("ProxyLogon")**

EMERGENCY DIRECTIVES

ED 21-02: Mitigate Microsoft Exchange On-Premises Product Vulnerabilities

CYBERSECURITY &
INFRASTRUCTURE
SECURITY AGENCY

13/03/2024

<https://bartoli.inginf.units.it>

82

Cybersecurity & Economics

13/03/2024

<https://bartoli.inginf.units.it>

83

Hhmmm...

- ❑ *Principle of Least Privilege: **1974***
- ❑ *Why in many practical scenarios it is still **not** enforced, **50 years later?***

13/03/2024

<https://bartoli.inginf.units.it>

84

Security is NEVER the ONLY objective (I)

- ❑ **Every** choice must be a tradeoff among:
 1. Security
 2. Cost
 3. Functionality
- ❑ Design, Development, Deployment, Usage, Maintenance
- ❑ In many practical cases, Security is sacrificed

13/03/2024

<https://bartoli.inginf.units.it>

85

Security is NEVER the ONLY objective (II)

- ❑ In many practical cases, Security is sacrificed
- ❑ The chosen tradeoff might be wrong (perhaps retrospectively)
- ❑ ...but it often is **economically rational**
 - ❑ More Security \Rightarrow More short term costs
 - ❑ Long term savings uncertain
 - ❑ Market forces could penalize short term costs

13/03/2024

<https://bartoli.inginf.units.it>

86

Think in Economical Terms

- ❑ To understand cybersecurity **never** think only in **technical** terms
 - ❑ Or, worse, in "moral" terms
- ❑ **Always** think in **economical** terms

- ❑ What is the cost?
 - ❑ Attack, Defense, Incident
- ❑ Who pays?

- ❑ **Money is what drives the world**
 - ❑ It may sound cynical...but thinking in these terms is very helpful

13/03/2024

<https://bartoli.inginf.units.it>

87

Key Practical Scenario: Administrators

Key Practical Scenario: Administrators

- ❑ Human operator H has to perform:
 1. **Daily** "normal" activities
 - ❑ Email, web browsing, programming, ...
 2. **Occasionally** "administration" activities
 - ❑ Server configuration,
Account / Access Rights management,
Program installation/removal, ...

- ❑ Which account(s) should H use?

13/03/2024

<https://bartoli.inginf.units.it>

89

Roadmap

- ❑ Common approach
- ❑ What should be done and why
- ❑ Better approach: Linux
- ❑ Better approach: Windows

13/03/2024

<https://bartoli.inginf.units.it>

90

Remark: RCE vulnerability

Malware has the privilege level of the vulnerable process

13/03/2024

<https://bartoli.inginf.units.it>

91

Common Approach

- ❑ Human operator H has to perform:
 1. Daily "normal" activities
 2. Occasionally "administration" activities
- ❑ H is given **one** account A with **high** privilege
- ❑ Is it wise?
- ❑ Why?

13/03/2024

<https://bartoli.inginf.units.it>

92

What should be done (and why)

- ❑ H is given **two** accounts: A-H, A-L
 - ❑ Use A-L for Daily / "normal"
 - ❑ Use A-H **only** for Occasional / "technical administration"

- ❑ Most of the time low privilege
- ❑ Much less opportunities for taking malware high privilege

13/03/2024

<https://bartoli.inginf.units.it>

93

Once again...Least privilege!

- ❑ **Every** program and every user of the system should operate using the **least** set of privileges **necessary** to complete the job...
- ❑ It also reduces the number of potential interactions among privileged programs to **the minimum for correct operation**, so that **unintentional, unwanted, or improper** uses of privilege are **less likely** to occur...

13/03/2024

<https://bartoli.inginf.units.it>

94

Much easier said than done

- ❑ H is given **two** accounts: A-H, A-L
 - ❑ Use A-L for Daily / "normal"
 - ❑ Use A-H **only** for Occasional / "technical administration"
- ❑ Require **strong** and **systematic** personal **discipline**
- ❑ "Why bother?!"
- ❑ How many accounts do you have on your Windows PC?
- ❑ Do they belong to the `Administrators` group?

13/03/2024

<https://bartoli.inginf.units.it>

95

Linux approach: `sudo`

- ❑ H is given **one** account A-L with **low privilege**
- ❑ H always executes shell with A-L...
- ❑ ...and may **temporarily** acquire **high privilege**: `sudo cmd`

- ❑ **Much more practical** than double account

13/03/2024

<https://bartoli.inginf.units.it>

96

sudo: details ("curiosity")

- ❑ To acquire high privilege with `sudo`:
 - ❑ A-L must belong to `sudoers` group (membership controlled by the `root` account)
 - ❑ A-L password must be provided again
- ❑ Normal users: **not** inserted in `sudoers`
- ❑ Administrators: inserted in `sudoers`

13/03/2024

<https://bartoli.inginf.units.it>

97

Windows approach:

UAC / run as administrator

- ❑ H is given **one** account A-L with **low privilege**
- ❑ H always executes shell with A-L...
- ❑ When launching a program C that we want to execute with high privilege:
 - ❑ C is launched with '`run as Administrator`' (which asks Administrator credentials)
- or
- ❑ C must be have been configured to ask for administrator credentials (UAC)

13/03/2024

<https://bartoli.inginf.units.it>

98

sudo **VS**

UAC / run as administrator

- ❑ Roughly equivalent (**if used properly**)
- ❑ In practice, in Windows, usage of a **single** account **with High privilege is quite common**
- ❑ Default configuration and standard practice encourage this approach
- ❑ ...which makes UAC / Run as admin **less effective** than sudo

Keep in mind

- ❑ Human operator H has to perform:
 1. Daily "normal" activities
 2. Occasionally "administration" activities
- ❑ H is given **one** account A with **high** privilege
- ❑ Very **common** (in Windows)
- ❑ Very **dangerous**

O.S. Access Control Essentials

User Groups (Account Groups)

- ❑ **Account** belongs to **one** or more **Groups**
(one is the **Primary** Group)
- ❑ Every resource has:
 - ❑ Owner Account
 - ❑ ACL with (Account / Group, ...) specified by Owner

ACL in theory

- ❑ Every Resource has:
 - ❑ **Owner** Account
 - ❑ (Account / Group, Operations) specified by Owner

	O1	O2	O3	...
U1	x	x		
U2	x		x	
U3	x		x	
...				

U = Account / Group

ACL in practice

- ❑ **MUCH MORE COMPLEX (and O.S.-dependent)**
- ❑ Typical (simplified) scenario in next slides

Linux Access Control (in a nutshell)

13/03/2024

<https://bartoli.inginf.units.it>

105

Linux Example: Files

Accounts described as:

ACL

- Owner
- Primary Group of the owner
- Other

	R	W	X
Owner	x	x	x
Group	x		x
Other	x		

Accounts have **Access Rights** R, W, X

Operations require one or more Access Rights

- Read → R
- Write → W
- Execute → X

13/03/2024

<https://bartoli.inginf.units.it>

106

Linux Example: Directories

Accounts described as:

ACL

- ☐ Owner
- ☐ Primary Group of the owner
- ☐ Other

	R	W	X
Owner	x	x	x
Group	x		x
Other	x		

Accounts have **Access Rights** R, W, X

Operations require one or more Access Rights

- ☐ Listing content → R
- ☐ Modifying content → W,X
- ☐ Listing content and ACLs, Use as current directory, ... → X

13/03/2024

<https://bartoli.inginf.units.it>

107

ACL in practice

~~ACL = (Accounts/Groups, Operations)~~

ACL = (Accounts/Groups, **Access Rights**)

- ☐ Managed by the Resource Owner

Mapping **Operation** → **Access Rights** needed

- ☐ Defined by the O.S. once and for all

13/03/2024

<https://bartoli.inginf.units.it>

108

Access Rights \equiv Permissions

- More or less synonyms
- Linux tends to use Access Rights
- Windows tends to use Permissions
- But you can find **both** terms in **both** environments

13/03/2024

<https://bartoli.inginf.units.it>

109

ACL in Linux

- ACL = (Accounts/Groups, **Access Rights**)
- Mapping **Operation** → **Access Rights** needed
- **Every** resource:
 - **3** Access Rights (R, W, X)
 - **3** entries for describing **all** the accounts
- Mapping Operation → Access Rights "≈intuitive"

13/03/2024

<https://bartoli.inginf.units.it>

110

Linux ACL: Representation

		Access Rights		
		R	W	X
Accounts	Owner	x	x	x
	Group	x		x
	Other	x		

"Standard"
representation

`rxw r-x r--`

13/03/2024

<https://bartoli.inginf.units.it>

111

Remark 1

- ❑ **Account** belongs to one or more **Groups** (one is the **Primary** Group)
- ❑ **Resource:**
 - ❑ **Owned** by an Account
Can be owned by **multiple** users
(thus **multiple** primary groups)
 - ❑ $ACL \equiv 3 \times 3$ matrix
More info needed
(more flexibility)
- ❑ Details omitted for simplicity

13/03/2024

<https://bartoli.inginf.units.it>

112

Remark 2

- ❑ `root` processes have **all** access rights on **all** resources
- ❑ Implemented with **capabilities**
 - ❑ Process with a certain capability \Rightarrow
Process bypasses access control checks for certain operations
 - ❑ A `root` process has all capabilities
- ❑ A process may be given a **subset** of the capabilities
- ❑ Granular control of high privilege

Windows Access Control (in a nutshell)

Windows Access Control

- ❑ **EXTREMELY COMPLEX**
- ❑ **TERMINOLOGY VERY CONFUSING**
 - ❑ Sometimes even incoherent

13/03/2024

<https://bartoli.inginf.units.it>

115

ACL in Windows (I)

- ❑ **Every** resource:
 - ❑ **3** Access Rights (R, W, X)
 - ❑ **3** entries for describing **all** the accounts
- ❑ Mapping Operation → Access Rights "≈intuitive"
- ❑ **MANY** Access Rights, usually **Resource-specific**
- ❑ Mapping Operation → Access Rights "**extremely complex**"
- ❑ ACL:
 - ❑ **LOTS** of entries
 - ❑ **VERY COMPLEX** rules for combining them

13/03/2024

<https://bartoli.inginf.units.it>

116

ACL in Windows (II)

Windows:

- ❑ **MANY** Access Rights, usually **Resource-specific**
- ❑ Mapping Operation → Access Rights "**extremely complex**"
- ❑ Example in the next two slides

13/03/2024

<https://bartoli.inginf.units.it>

117

Windows Example: Access Rights (I)

- ❑ **Operation** *"Execute file F"*
- ❑ Required **access rights** on F:
 - ❑ "GenericExecute"
 - ❑ "FileReadAttributes"
 - ❑ "Synchronize"
- ❑ Required **access rights** on D that contains F:
 - ❑ "FileTraverse"

13/03/2024

<https://bartoli.inginf.units.it>

118

Windows Example: Access Rights

- Registry:
 - Database of <name, value> (**keys**)
 - Keys are organized as a **hierarchy** based on their name (separator /)
 - Describes the o.s. configuration
- **Operation** *"Create registry key"*
- Required **access rights** on parent key:
 - "KeyWrite"
 - "KeyCreateSubKey"

13/03/2024

<https://bartoli.inginf.units.it>

119

ACL in Windows (III)

- ACL:
 - **LOTS** of entries
 - **VERY COMPLEX** rules for combining them
- Example in the next slides

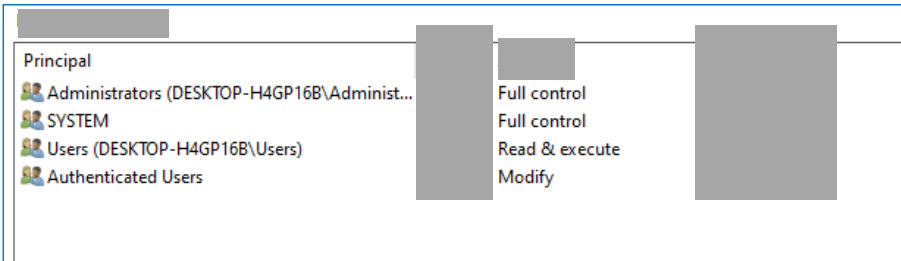

13/03/2024

<https://bartoli.inginf.units.it>

120

Windows Example: File (I)

- ACL ≡ List of **Access Control Entries**

Principal	Permissions
Administrators (DESKTOP-H4GP16B\Administ...	Full control
SYSTEM	Full control
Users (DESKTOP-H4GP16B\Users)	Read & execute
Authenticated Users	Modify

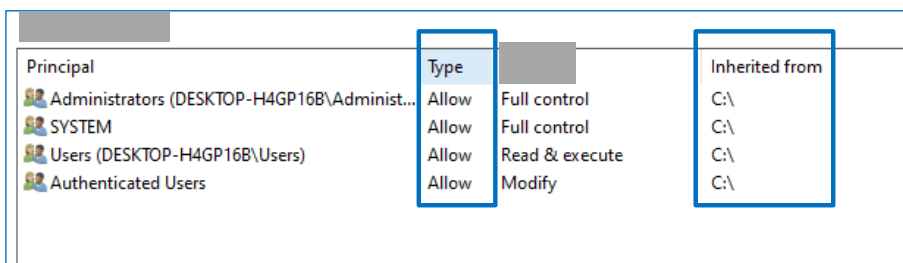

- There can be many entries (granularity single account)

⇒ multiple entries for a given principal

⇒ complex rules for choosing the entry

Windows Example: File (II)

- ACL ≡ List of **Access Control Entries**
- Allow or **Deny**
- Can be **inherited** from "parent resource"

Principal	Type	Permissions	Inherited from
Administrators (DESKTOP-H4GP16B\Administ...	Allow	Full control	C:\
SYSTEM	Allow	Full control	C:\
Users (DESKTOP-H4GP16B\Users)	Allow	Read & execute	C:\
Authenticated Users	Allow	Modify	C:\

- Complex rules for resolving **conflicts**

Nightmare Terminology (I)

"Permission" is usually a synonym of "Access Right"

*So is it an Access Right entry?
Shouldn't it be an ACL entry?*

Permission entries:		
Principal		
Administrators (DESKTOP-H4GP16B\Administ...	Full control	
SYSTEM	Full control	
Users (DESKTOP-H4GP16B\Users)	Read & execute	
Authenticated Users	Modify	

Nightmare Terminology (II)

What it means "access", exactly?

What is the difference w.r.t. "operation"?

Permission entries:		
Principal		
Administrators (DESKTOP-H4GP16B\Administ...	Access	
SYSTEM	Full control	
Users (DESKTOP-H4GP16B\Users)	Full control	
Authenticated Users	Read & execute	
	Modify	

Remark

```
$ ls -l
```

```
drwxr-xr-x. 4 root root   68 Jun 13 20:25 tuned
-rw-r--r--. 1 root root 4017 Feb 24  2022 vimrc
```

❑ Linux: You see/manage Access Rights

Permission entries:

Principal	Type	Access	Inherited from
Administrators (DESKTOP-H4GP16B\Administ...	Allow	Full control	C:\
SYSTEM	Allow	Full control	C:\
Users (DESKTOP-H4GP16B\Users)	Allow	Read & execute	C:\
Authenticated Users	Allow	Modify	C:\

❑ Windows: You see/manage "Access" (whatever it means):
not Access Rights

❑ Access Rights are hidden behind the user interface

13/03/2024

<https://bartoli.inginf.units.it>

125

Show ACL from shell

❑ Linux

❑ `ls -l filename`

❑ Windows

❑ `icacls filename`

❑ Ask ChatGPT to explain output

BA You
can you explain this Windows command execution?

```
C:\New-MyCloud\Dropbox\Portable Programs>icacls "JoplinPortable.exe"
JoplinPortable.exe BUILTIN\Administrators:(I)(F)
                  NT AUTHORITY\SYSTEM:(I)(F)
                  BUILTIN\Users:(I)(RX)
                  NT AUTHORITY\Authenticated Users:(I)(M)

Successfully processed 1 files; Failed processing 0 files
```

13/03/2024

<https://bartoli.inginf.units.it>

126

Smartphone Access Control (in a nutshell)

13/03/2024

<https://bartoli.inginf.units.it>

127

Keep in mind 1 (REMINDE)

- ❑ ACLs have the form (Account, Operation)

- ❑ ACLs do not distinguish between **different commands** with the **same account**
- ❑ All processes with the same account can do the same things
- ❑ Irrespective of who developed their code

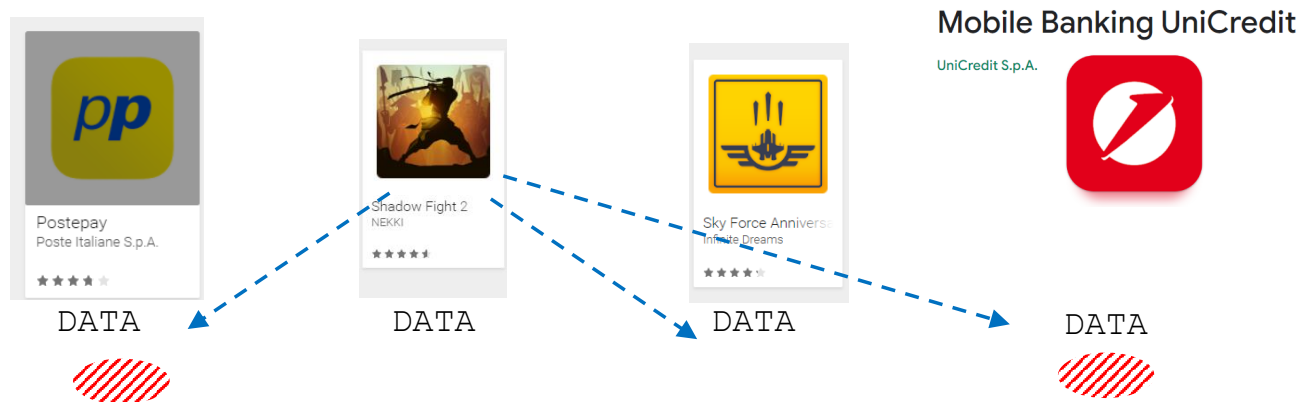

13/03/2024

<https://bartoli.inginf.units.it>

128

Different Point of View

- ❑ ACLs have the form (Account, Operation)
- ❑ Any app of an user can access **all data of any other app** of that user

13/03/2024

<https://bartoli.inginf.units.it>

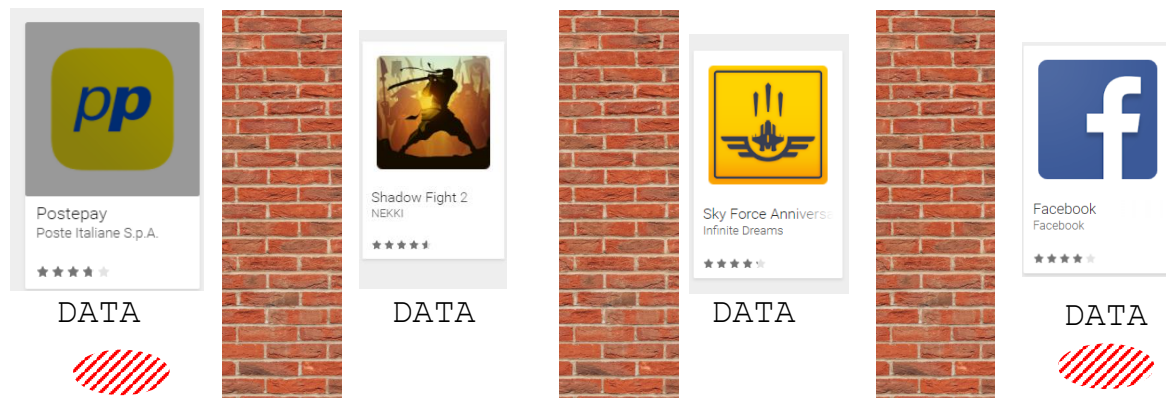

129

Smartphone Access Control (I)

- ❑ Each installed app has an identifier
- ❑ ACLs are expressed in terms of ([Account, app-identifier], Operation)

- ❑ Data of an app can be **isolated** from other apps of **the same** user

13/03/2024

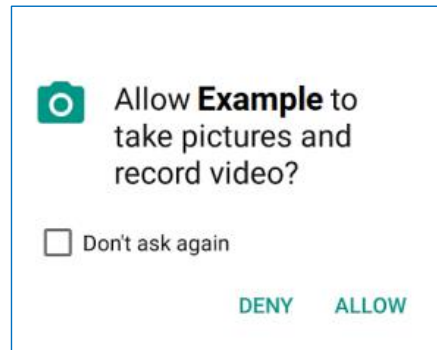

<https://bartoli.inginf.units.it>

130

Smartphone

Access Control (II)

- Access Rights of an app on "critical" resources are granted by the Human Operator when installing the app

13/03/2024

<https://bartoli.inginf.units.it>

131

Understanding Access Control

<https://bartoli.inginf.units.it>

132

REMIND

Access Control - O.S. Level

- ❑ Every access to **resources** is mediated (**guarded**) by the O.S.
- ❑ Every resource has an **ACL**
- ❑ O.S. decides whether to execute the operation:
 - ❑ Account, Operation, Resource.ACL

13/03/2024

<https://bartoli.inginf.units.it>

133

Access Control = Authorization (≠ Authentication)

- ❑ Account is an **input** data (it is "certain"):
it is determined **prior** to issuing the OpRequest
- ❑ How it is determined is a **different** problem
 - ❑ **Authentication** is usually required

13/03/2024

<https://bartoli.inginf.units.it>

134

Access Control: Terminology

- ❑ Every access to **resources** is mediated (**guarded**) by the Reference Monitor
- ❑ Every resource has an **ACL**
- ❑ Reference Monitor decides whether to execute the operation:
 - ❑ Principal, Operation, Resource.ACL

13/03/2024

<https://bartoli.inginf.units.it>

135

Everything is perfect (I)

- ❑ Reference Monitor:
 - ❑ No way of **bypassing** it
 - ❑ No **mistakes**

13/03/2024

<https://bartoli.inginf.units.it>

136

Everything is perfect (II)

- Principal:

- No way of impersonating a **different** Principal

Everything is perfect (III)

- Principals are **not** able to **modify**:

- Reference Monitor

- ACLs
(unless through authorized operations)

Why Cybersecurity is an issue? (I)

- ❑ Actual Security Policy **different from the intended one** (ACLs allow operations that should not be allowed)
- ❑ Something is **not** perfect:
 - ❑ Entity that should not be able to control Principal-A may control Principal-A
 - ❑ ...
- ❑ See "Midnight Blizzard attack to Microsoft" on the companion website:
 - ❑ Test application → Senior leadership Cybersec people email and docs
- ❑ Incident in Trieste (27K ransom paid)
 - ❑ Secretary receives pdf invoice with malware from (unsuspecting) commercial partner
 - ❑ Malware encrypts all files in all folders of the company filesystem

13/03/2024

<https://bartoli.inginf.units.it>

139

Why Cybersecurity is an issue? (II)

- ❑ Actual Security Policy **different from the intended one** (ACLs allow operations that should not be allowed)
- ❑ Something is **not** perfect:
 - ❑ Entity that should not be able to control Principal-A may control Principal-A
 - ❑ Reference Monitor has **mistakes**
 - ❑ Reference Monitor may be **bypassed**
 - ❑ Principal-A may emit (OpReq, **Principal-B**)
- ❑ Do NOT consider these cases! (for the time being...)

13/03/2024

<https://bartoli.inginf.units.it>

140

Access Control: FUNDAMENTAL Mechanism

13/03/2024

<https://bartoli.inginf.units.it>

141

Application Resource \neq O.S. Resource

- ❑ **Mail server** manages **mailboxes**
- ❑ Mailbox operations are **not** defined in the o.s.
- ❑ Access decisions must be taken by the mail server (**not** the o.s.)

- ❑ **Web server** manages **URLs**
- ❑ URL operations are **not** defined in the o.s.
- ❑ Access decisions must be taken by the web server (**not** the o.s.)

How does access control work for servers?

13/03/2024

<https://bartoli.inginf.units.it>

142

What we need

❑ Resource access must be mediated:

- ❑ Operating system level
- ❑ Application level

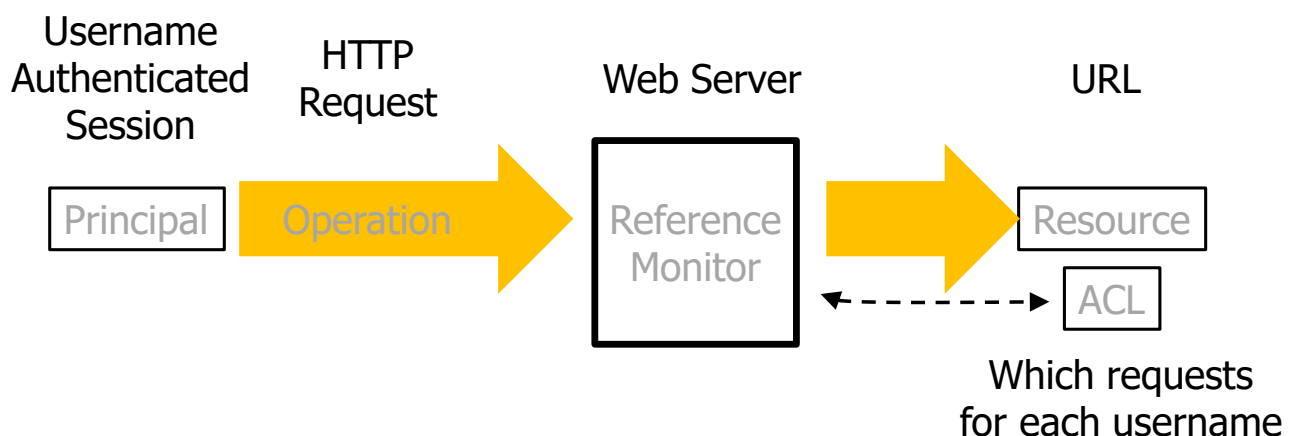

❑ Mechanisms **independent of each other**

13/03/2024

<https://bartoli.inginf.units.it>

143

Access Control – Web Server

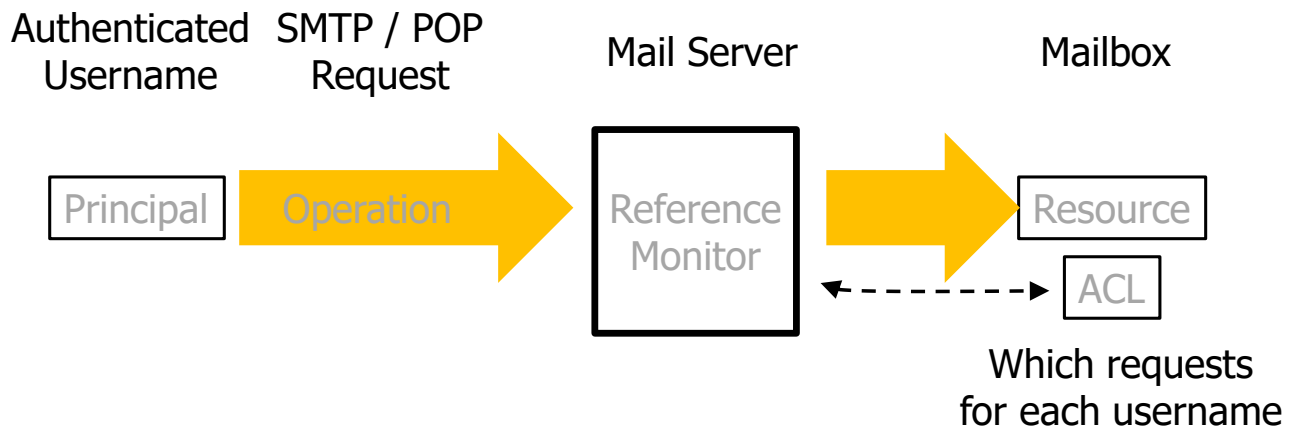

13/03/2024

<https://bartoli.inginf.units.it>

144

Access Control – Mail Server

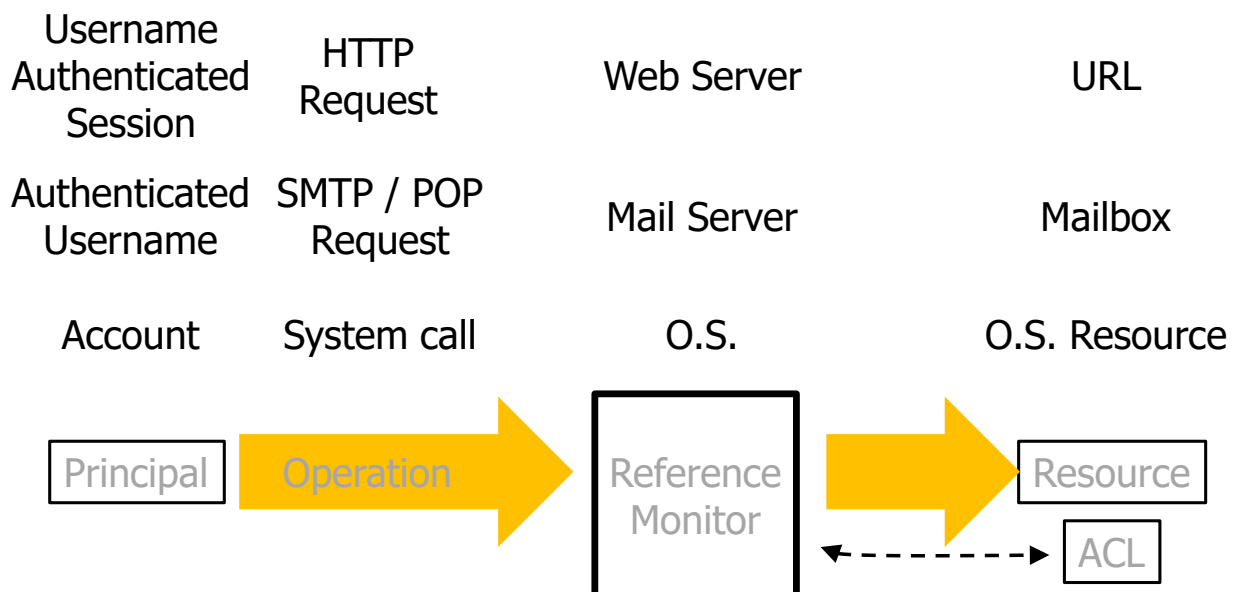

13/03/2024

<https://bartoli.inginf.units.it>

145

Access Control: Abstract (=GENERAL) Model

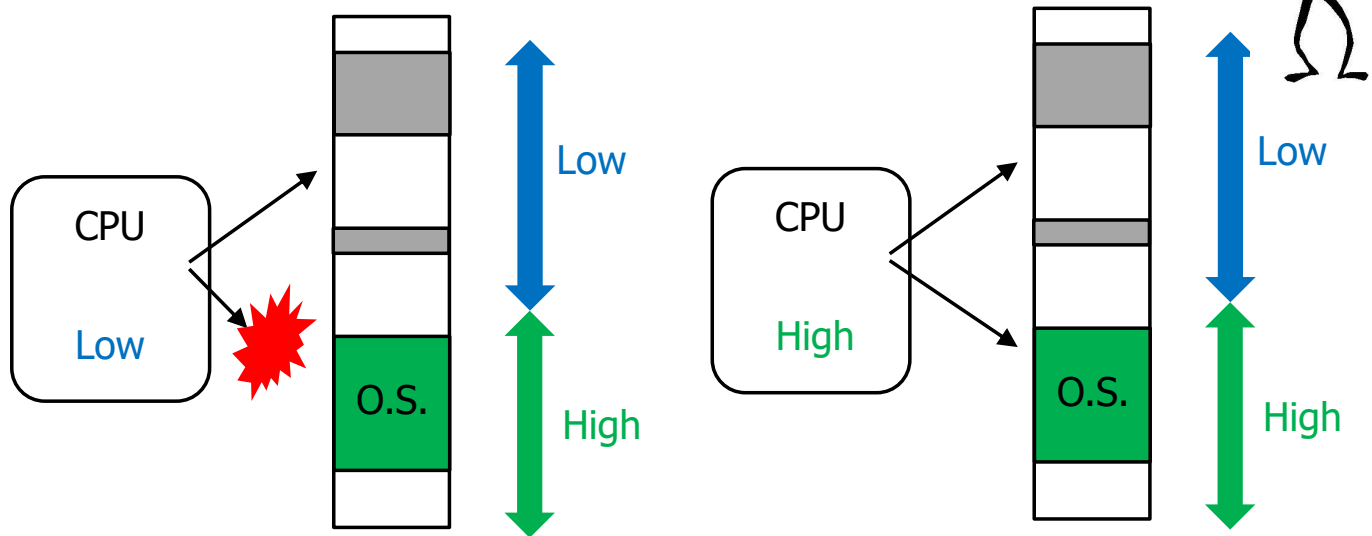

13/03/2024

<https://bartoli.inginf.units.it>

146

Hhmmm...

- ❑ How can **the memory** know which privilege level can access it?
- ❑ How is this security policy actually **enforced**?

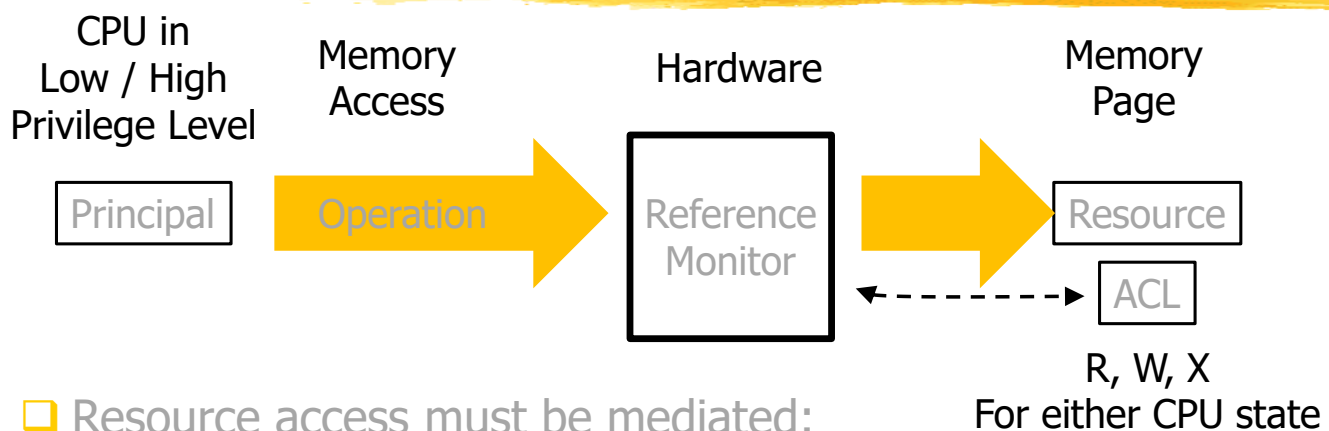

13/03/2024

<https://bartoli.inginf.units.it>

147

A truly GENERAL model

- ❑ Resource access must be mediated:
 - ❑ Operating system level
 - ❑ Application level
 - ❑ Hardware level
- ❑ Mechanisms **independent of each other**

13/03/2024

<https://bartoli.inginf.units.it>

148

Access Control

- ❑ **Fundamental** feature of computer systems
- ❑ **Enforces** the **security policy**: "who can do what"
- ❑ Occurs at **multiple** and **different** levels:
 - ❑ Application
 - ❑ Operating system
 - ❑ Hardware
- ❑ Each level:
 - ❑ Is **independent** of the other levels
 - ❑ Has **its own** mechanisms

13/03/2024

<https://bartoli.inginf.units.it>

149

Saltzer and Schroeder (1974)

- ❑ **Complete mediation: Every access to every object must be checked for authority.**
- ❑ This principle, when systematically applied, **is the primary underpinning** of the protection system...
- ❑ It implies that **a foolproof method of identifying the source of every request** must be devised.
- ❑ Please take a moment to reflect and admire its depth and generality
- ❑ We will find more examples of its relevance

13/03/2024

<https://bartoli.inginf.units.it>

150

Access Control in Large Organizations

13/03/2024

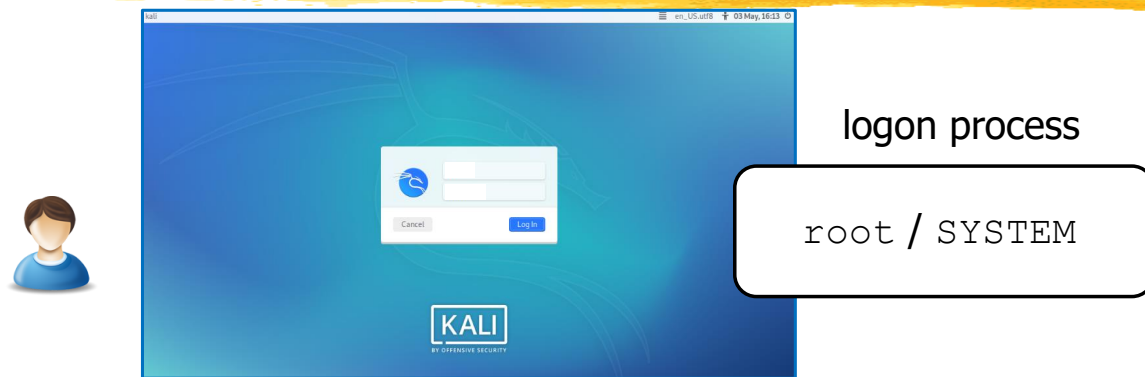

<https://bartoli.inginf.units.it>

151

Authentication

Where are Accounts defined?

1. Wait for credentials
2. Validate credentials (authenticate account A2)
3. Spawn GUI process that changes account to A2

13/03/2024

<https://bartoli.inginf.units.it>

153

Authentication DB: Local

Account Password

...	
Paolo	pwd-Paolo
...	

One row for each Account

AuthDB

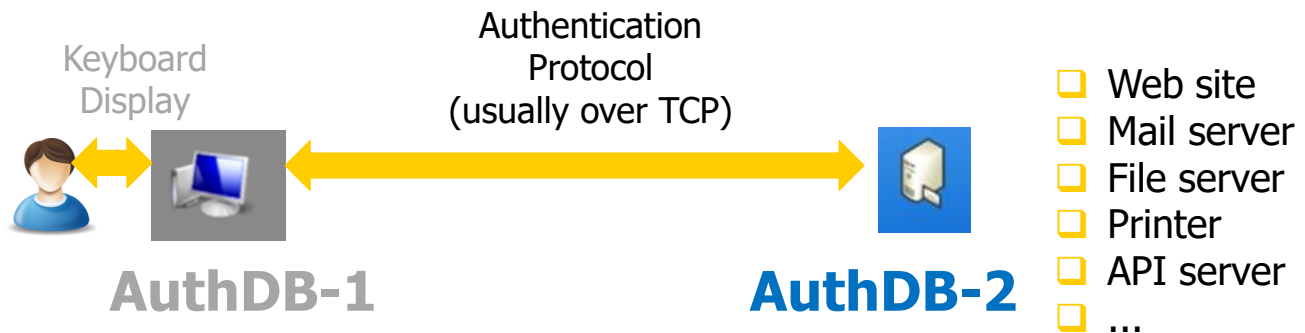

- ❑ Impersonating an account requires proving knowledge of a certain **secret** (password)
- ❑ AuthDB usually managed by the **operating system** (a certain file, at a certain location)

13/03/2024

<https://bartoli.inginf.units.it>

154

Authentication DB: Network (I)

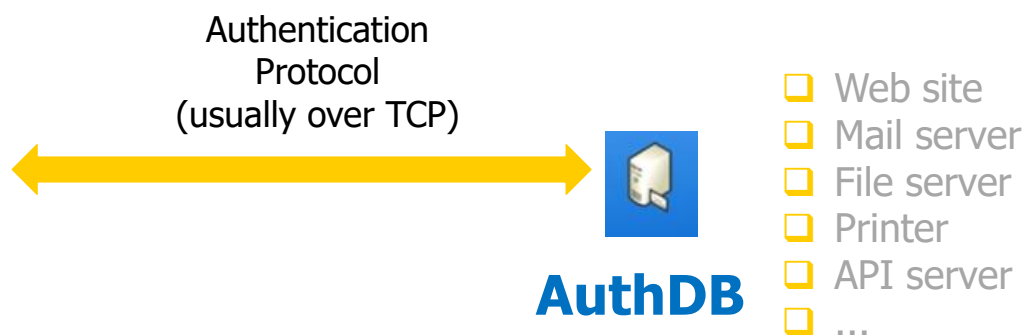

- Either the same or different organizations
- Sets of accounts and passwords completely independent of each other

13/03/2024

<https://bartoli.inginf.units.it>

155

Authentication DB: Network (II)

- Depending on the server, AuthDB may be either:
 1. AuthDB of the local operating system
 2. **Another** AuthDB managed by the server (usually stored in a **database table**)

13/03/2024

<https://bartoli.inginf.units.it>

156

Large Organizations

<https://bartoli.inginf.units.it>

157

Large Organizations (I-a)

Tens/Hundreds of Servers
(storing **Files, Databases**)

Thousands of Workstations / Notebooks
(either private or shared)

Thousands of Accounts
(**tens** of partially overlapping **Groups**)

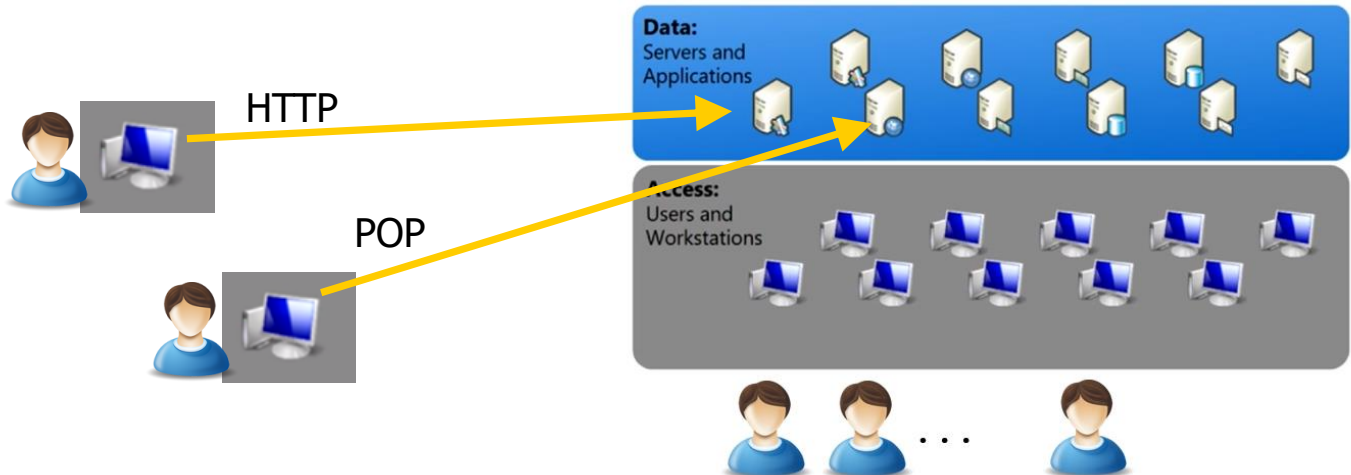

<https://bartoli.inginf.units.it>

158

Large Organizations (I-b)

Some Servers may be accessed
from the **outside**

<https://bartoli.inginf.units.it>

159

Large Organizations (II)

Resources

Routers, Firewalls, Switches, Networks,...

Servers
(storing **Files, Databases**)

Workstations / Notebooks
(either private or shared)

Accounts
(partially overlapping **Groups**)

Identities

<https://bartoli.inginf.units.it>

160

Access Control

❑ Every resource access must follow this framework

- ❑ Application level (e.g., access to a remote server)
- ❑ O.S. level (e.g., shell / GUI)

❑ Pre-requisite: Authentication

13/03/2024

<https://bartoli.inginf.units.it>

161

Authentication: Key practical requirement

We do **not** want a **separate** AuthDB
on **each** Reference Monitor

(identity management would be a nightmare)

<https://bartoli.inginf.units.it>

162

Key Practical Problems

- ☐ Can account U modify file F?
- ☐ Can account U read database D?
- ☐ Can account U logon on computer C?
- ☐ ...
- ☐ Can account U at computer C access server S?
- ☐ ...
- ☐ Can computer C connect to network N?
- ☐ Can computer C access server S?
- ☐ ...

<https://bartoli.inginf.units.it>

163

Authorization: Key practical requirement

We do **not** want to specify ACLs
separately on **each** resource

(access rights management would be a nightmare)

<https://bartoli.inginf.units.it>

164

Directory Service

DIRECTORY SERVICE

- ❑ **Centralized repository (Directory Service)** describes:
 - ❑ All **identities** (including their credentials)
 - ❑ All **resources**
 - ❑ All **access rights** of identities to resources (ACLs)

<https://bartoli.inginf.units.it>

165

Example: myself@UniTS

- ❑ Every account is described in our Directory Service
- ❑ My description consists of **>60 attributes**

accountExpires	Integer8	1 0x0
cn	DirectoryString	1 BARTOLI ALBERTO [5943]
lastLogonTimestamp	Integer8	1 2/10/2023 13:22
mail	DirectoryString	1 bartoli.alberto@units.it
mAPIRecipient	Boolean	1 FALSE
name	DirectoryString	1 BARTOLI ALBERTO [5943]
...		

<https://bartoli.inginf.units.it>

166

Single Sign On (SSO)

- ❑ **Identities** and **Credentials** stored in DS
- ❑ Valid **everywhere**
- ❑ **Every authentication** involves DS
- ❑ Several possible implementations

<https://bartoli.inginf.units.it>

167

SSO + Centralized Authorization

- ❑ **Resources** and **Access Rights (\approx ACLs)** stored in DS
- ❑ Valid **everywhere**
- ❑ **Every authorization** involves DS
- ❑ Several possible implementations

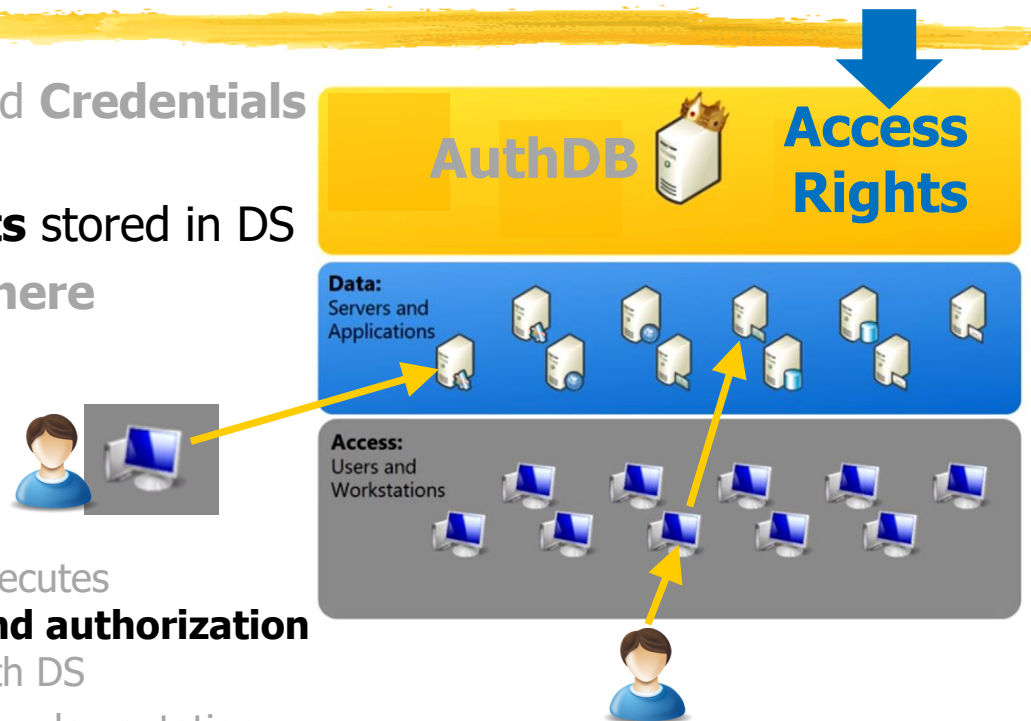

<https://bartoli.inginf.units.it>

168

SSO + Centralized Authorization

- ❑ **Identities and Credentials** stored in DS
- ❑ **Access Rights** stored in DS
- ❑ Valid **everywhere**

- ❑ Each resource executes authentication **and authorization** by interacting with DS
- ❑ Several possible implementations

<https://bartoli.inginf.units.it>

169

Identity and Access Management (IAM)

- ❑ **Procedures and technologies** for management of individual **identities**, their **authentication**, **authorization**, and **access rights**
- ❑ **within** or **across** **enterprise** boundaries

<https://bartoli.inginf.units.it>

170

Our focus

- ❑ Our focus is **within** enterprise boundaries
 - ❑ Account and resource in the same organization
- ❑ Widely prevalent technology:
 - ❑ **Windows Active Directory**
 - ❑ **Domain** \approx All IT entities in an organization
 - ❑ **Domain Controller** \approx Directory Service
- ❑ Technologies **across** enterprise boundaries
 - ❑ OAuth, SAML (SPID)
 - ❑ Kerberos realms

<https://bartoli.inginf.units.it>

171

Our learning path

- ❑ Every authentication and every authorization involves DS
- ❑ Several possible implementations

1. LDAP SSO (outline)
2. ...
3. Passwords and MFA
4. NTLM
5. Kerberos

<https://bartoli.inginf.units.it>

172

Real Usage (in Windows Active Directory)

- ❑ **Kerberos**
 - ❑ **Default** for Windows software
- ❑ **NTLM**
 - ❑ Supported for **compatibility** in Windows software
 - ❑ **"It should be disabled for security reasons" (Microsoft 2010)**
 - ❑ It is still with us
- ❑ **LDAP SSO**
 - ❑ Used **only** by software hard to integrate in Windows AD
 - ❑ Example: Web applications on Linux (e.g., `esse3`)
 - ❑ Example: Enterprise Wi-Fi authentication server (e.g. `eduroam`)

<https://bartoli.inginf.units.it>

173

LDAP SSO

<https://bartoli.inginf.units.it>

174

LDAP: Double Meaning

- ❑ Lightweight **D**irectory **A**ccess **P**rotocol

DIRECTORY SERVICE

- ❑ A **standard** for **describing** IT entities:

- ❑ Identities
- ❑ Credentials
- ❑ Resources
- ❑ Access Rights

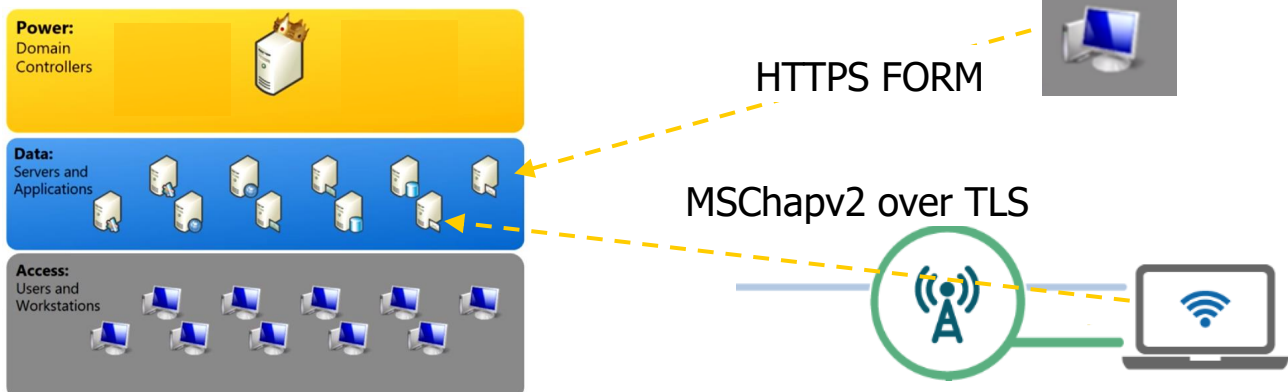

- ❑ A **protocol** for interacting with a Directory Service (server that stores those descriptions)

175

Practical Problem

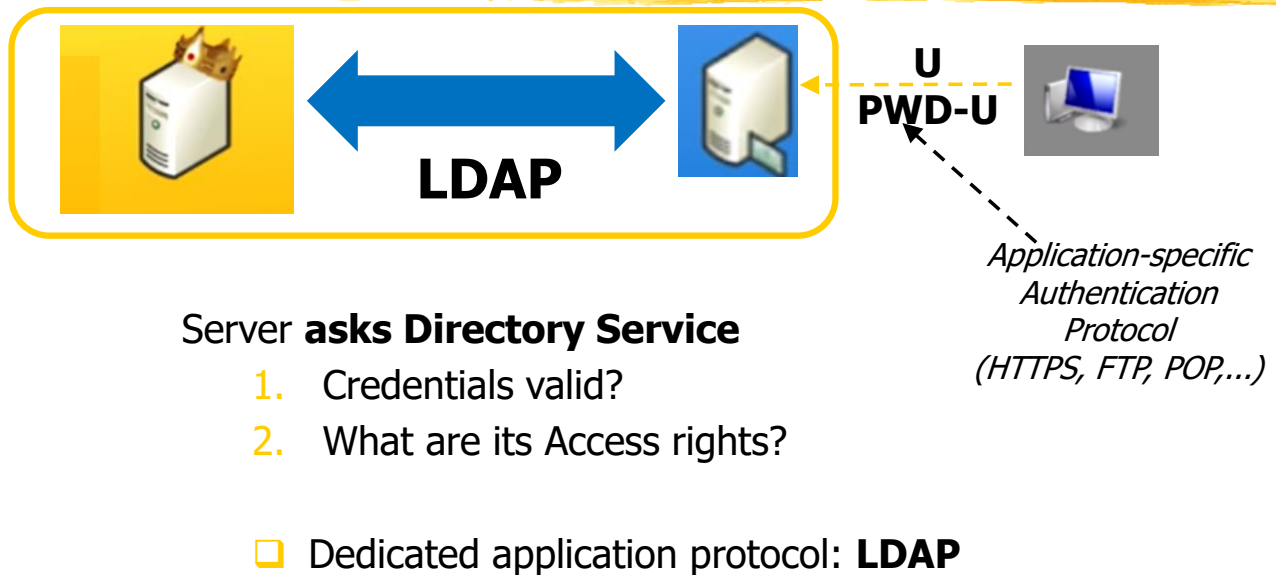

- ❑ Not every software can act as a client for Windows Active Directory
 - ❑ Example: Web applications on Linux (e.g., esse3)
 - ❑ Example: Enterprise Wi-Fi authentication server (e.g. eduroam)
- ❑ How do they execute **authentication**?
- ❑ How do they execute **authorization**?

Common Solution (outline)

<https://bartoli.inginf.units.it>

177

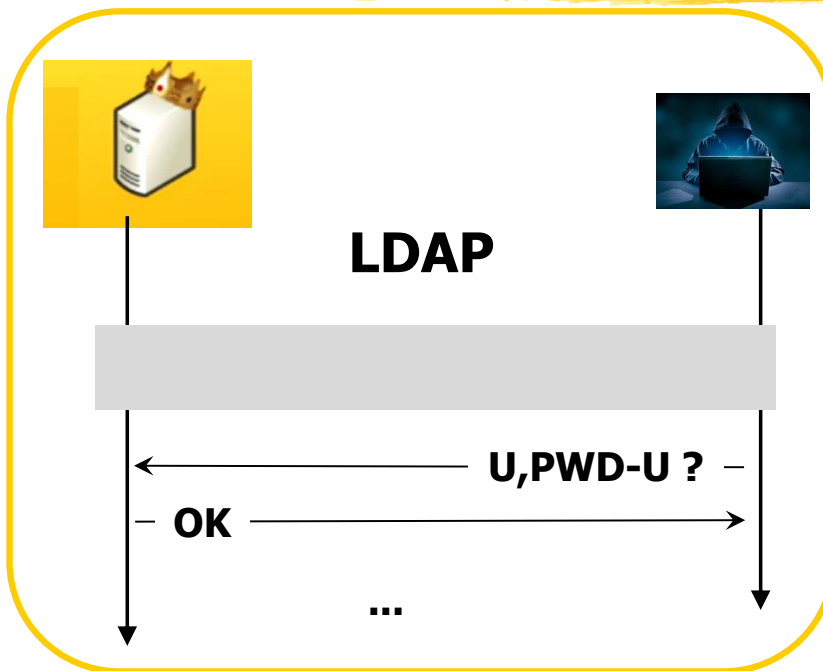

LDAP SSO (I)

<https://bartoli.inginf.units.it>

178

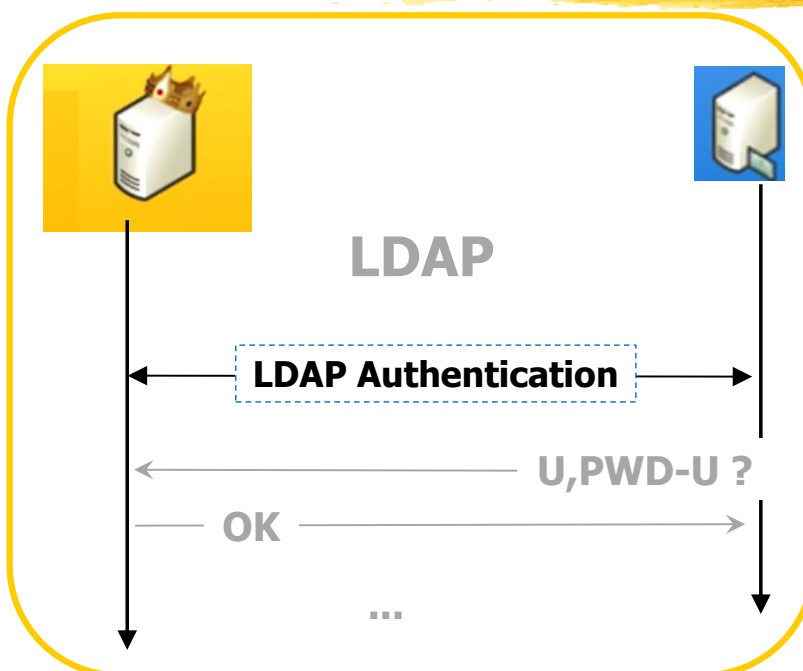

Hhmmm...

<https://bartoli.inginf.units.it>

179

LDAP SSO (II)

- ❑ Certain LDAP operations require **LDAP authentication** of the client **application**
- ❑ Several options in LDAP
 - ❑ TLS+username/password (**LDAPS**)
 - ❑ ...
